It also explored engine models and analysis of cylinder bore, piston stresses and temperature effects. This book includes recent literature and focuses on current modeling and simulation trends for internal combustion engines. Readers will gain knowledge about engine process simulation and modeling helpful for the development of efficient and emission free engines. A few chapters highlight the review of state of the art models for spray combustion and emissions focusing on the theory, models and their applications from an engine point of view. This volume would be of interest to professionals, post graduate students involved in alternative fuels, IC engines, engine modeling and simulation and environmental research.

Simulating Combustion Günter P. Merker, Christian Schwarz, Gunnar Stiesch, Frank Otto, 2005-12-17 The numerical simulation of combustion processes in internal combustion engines including also the formation of pollutants has become increasingly important in the recent years and today the simulation of those processes has already become an indispensable tool when developing new combustion concepts. While pure thermodynamic models are well established tools that are in use for the simulation of the transient behavior of complex systems for a long time the phenomenological models have become more important in the recent years and have also been implemented in these simulation programs. In contrast to this the three dimensional simulation of in cylinder combustion i.e. the detailed integrated and continuous simulation of the process chain injection, mixture formation, ignition, heat release due to combustion and formation of pollutants has been significantly improved but there is still a number of challenging problems to solve regarding for example the exact description of processes like the structure of turbulence during combustion as well as the appropriate choice of the numerical grid. While chapter 2 includes a short introduction of functionality and operating modes of internal combustion engines the basics of kinetic reactions are presented in chapter 3. In chapter 4 the physical and chemical processes taking place in the combustion chamber are described. Chapter 5 is about phenomenological multi zone models and in chapter 6 the formation of pollutants is described.
