Mastering Modern Psychological Testing Cecil R. Reynolds, Robert A. Altmann, Daniel N. Allen, 2021-05-13 This book provides a comprehensive introduction to psychological assessment and covers areas not typically addressed in existing test and measurements texts such as neuropsychological assessment and the use of tests in forensics settings The book introduces the vocabulary of the profession and the most basic mathematics of testing early as being fundamental to understanding the field Numerous examples are drawn from tests that the authors have written or otherwise helped to develop reflecting the authors deep understanding of these tests and their familiarity with problems encountered in test development use and interpretation Following the introduction of the basic areas of psychometrics the book moves to areas of testing that represent various approaches to measuring different psychological constructs memory language executive function etc with emphasis on the complex issue of cultural bias in testing Examples of existing tests are given throughout the book however this book is not designed to prepare students to go out and administer score and interpret specific psychological tests Rather the purpose of this book is to provide the foundational core of knowledge about tests measurement and assessment constructs issues and quantitative tools Explains what constitutes a psychological test how tests are developed how they are best used and how to evaluate their strengths and weaknesses Describes areas of testing that represent different approaches to measuring different psychological constructs Explains applications of psychological testing to issues in the courts Addresses how test authors and publishers design and research tests to address the difficult and demanding issues of cultural differences in test performance and interpretation of test results

Mastering Modern Psychological Testing Cecil R. Reynolds, Ronald B. Livingston, 2012 Testing Measurement Assessment Mastering Modern Psychological Testing Theory Methods presents quality written research in a thorough and comprehensive manner that allows students to master the material This text provides a comprehensive introduction to psychological assessment and covers areas not typically addressed in existing test and measurements texts such as neuropsychological assessment and the use of tests in forensics settings Mastering Modern Psychological Testing addresses special topics in psychological testing and includes special material on test development written by a leading test developer as well as relevant examples The book is designed for undergraduate courses in Psychological Testing Assessment Testing Theory Methods Learning Goals Upon completing this book readers should be able to Understand what constitutes a psychological test how tests are developed how they are best used and how to evaluate their strengths and weaknesses Recognize the development process and how the psychometric properties of tests are constructed so they have the generalized knowledge to always learn about any test Engage in areas of testing that represent different approaches to measuring different psychological constructs Understand the difficult and demanding area of how tests are applied and interpreted across cultures within the United States

Critical Debates on Quantitative Psychology and

Measurement: Revived and Novel Perspectives on Fundamental Problems Jana Uher, Jan Ketil Arnulf, Barbara Hanfstingl, 2025-11-14 Psychology's continued crises in replicability, validity, generalisability, and thus confidence in its findings are currently attributed primarily to questionable research practices (QRPs) e.g. p-hacking, HARKing, cherry-picking. Popular, pertinent debates therefore centre on proposals for remedying inappropriate method applications e.g. larger samples, robust statistics, pre-registration, replication. Replicable, non-random effects of psychological interventions and differentiations between individuals are essential for applied purposes. But current approaches to replicability, validity, and psychometric modelling are merely pragmatic, providing evidence of just utility to discriminate well and consistently between cases and in ways considered important e.g. social relevance, relations to future outcomes. Yet without understanding the study phenomena in themselves e.g. individuals' experience, beliefs, thought processes, and without elaborating how relevant features of them can be made amenable to quantitative investigation, and if at all, the quantity objection, the actual causes of replicable quantitative findings cannot be explored. These causes, however, may be completely unrelated to the actual study phenomena e.g. methodomorphism. This concerns in particular the attributes and latent constructs studied in psychology, given that these are theoretical and statistical concepts that are attributed and construed as means of investigation and that only refer to but do not constitute the actual study phenomena in themselves. We believe the currently debated deficiencies of quantitative practices in psychology are just surface symptoms, whereas fundamental problems e.g. the inappropriateness of statistical assumptions for psychical phenomena and the actual root causes underlying psychology's crises and disputes around its scientific status are still hardly addressed. With this Research Topic, we want to give new impetus to critical debates on the epistemological and methodological foundations of quantitative methods and measurement in psychology, including problems long known but still hardly considered. Examples are: The behavioural and psychical phenomena's non-ergodicity rendering sample-level statistics uninformative about individual-level phenomena; Psychometricians' alignment of results to statistical theories rather than to features of the study phenomena, biasing inferences on the latter; Ideas that laypeople's intuitive judgements could reveal quantitative structures in complex, largely unobservable phenomena; The still unsupported claim that psychical phenomena could have quantitative properties at all and could thus be measured; The fact that psychometric structures shown for verbal item judgements can also be produced by semantic and Artificial Intelligence (AI) algorithms e.g. ChatGPT without collecting any empirical data; Still, most quantitative psychologists seem fairly unconcerned about the strong reliance on everyday language e.g. in ratings scales and the imprecise concepts of psychological measurement, perhaps because their consequences do not become as straightforwardly apparent as in other disciplines such as in physics, chemistry, and medicine, where imprecise measurement can entail the collapse of buildings, chemical explosions, or drug overdoses. But where does the loose jargon around measurement variables and psychometrics go seriously wrong in psychology? These and further contradictions, problems, and challenges underlying established quantitative practices in psychology must be

addressed to tackle the discipline's continued crises and to develop new approaches that are needed to advance psychology as a science. We invite from all fields contributions that critically explore and open up new perspectives on the foundations of quantification and measurement in psychology including perspectives still hardly considered e.g. qualitative mathematics, complex dynamic systems, fuzzy systems, modelling, machine learning. We are also interested in methods for generating quantitative data either executed by persons e.g. time-based observations, computer-based coding or by automated technology e.g. ecological momentary monitoring, life logging, reality mining. However, other than commonly done, we are explicitly not seeking proposals for improving specific techniques of data analysis e.g. statistical or latent variable models. Instead, our focus is on making explicit and scrutinising the implicitly underlying rationales and fundamental principles, thus the theory, philosophy and methodology on which quantitative research in psychology currently is or should be built in the future. This also includes critical views on whether or not quantitative investigations are meaningful at all for a science exploring behaviour, mind and society and thus also contributions to the psychology, sociology and philosophy of science in this field.

The Practice of Psychological Assessment Norman Tallent, 1992. This volume examines psychological assessment and psychological assessors, an indissoluble combination in the professional enterprise of understanding individuals for defined and useful purposes. Extremely practice-oriented, the book deals with the nuts and bolts of tests and testing, observing and interviewing, theories of tests and measurement, personality theory, classification, ordering data and applications involved with selecting and formulating meaningful psychological information. The book includes helpful guidelines to practice approaches and strategies. [General Catalog -- University of California, Santa Cruz](#) University of California, Santa Cruz, 1999

Psychology in Contemporary China focuses on the advancement of psychology in China and the different areas to which this field is applied. The book proceeds by outlining the evolution, nature and characteristics of Chinese psychology. The text then points out that studies on this discipline are generally difficult because of the lack of publication of resources in English. The process of learning this field is often done through visitations with specialists going to China to conduct research and lectures. The text investigates the evolution of psychology in China as well as its progress through
