Applications of HAZOP and What-If Safety Reviews to the Petroleum, Petrochemical and Chemical Industries Dennis P. Nolan, 1994-12-31 This publication is intended to provide guidance to HAZOP Hazard and Operability and What If review teams associated with the petroleum petrochemical and chemical industries It describes the nature responsibilities methods and documentation required in the performance of such reviews This ensures the reviews are conducted in a timely effective and professional manner as may be prescribed by a company s Process Safety Management PSM Policy This book can be used as a practical reference to prepare the safety review requirements for these industries and their process safety management systems The safety of petroleum and chemical facilities is an important part of a company s operations Recent

worldwide petrochemical safety regulations and a company's own process safety management policies would require that a process hazard analysis (PHA) review of its existing and proposed petroleum operations be accomplished. The limits of hazardous substances cited by both the US Occupational Safety and Health Administration (OSHA) and the Environmental Protection Agency (EPA) regulations dictate the applications of process safety management elements at almost all of a company's facilities. These reviews are intended to reduce the probability and/or consequences of a major incident that would have a detrimental impact to the employees, the public's well-being, onsite or offsite properties, the environment, and most important to a company itself, its continued business operation and survival. Process hazard analysis reviews are not intended to identify the minor slips, trips, or falls; these are the responsibility of the company's general safety requirements and are well established. The process hazard analysis is looking for the major incidents which have the potential for severe impacts. HAZOP and What If reviews are two of the most common petroleum and chemical industries qualitative methods used to conduct process hazard analyses. Up to 80% of a company's process hazard analyses may consist of HAZOP and What If reviews, with the remainder 20% from checklist, Fault Tree Analysis, Event Tree, Failure Mode and Effects Analysis, etc. An experienced review team can use the analysis to generate possible deviations from design, construction, modification, and operating intent that define potential consequences. These consequences can then be prevented and/or mitigated by the application of the appropriate safeguards.

**Reliability and Risk Assessment** John D. Andrews, T. R. Moss, 1993. Accidents at process plants such as Windscale, Piper Alpha, and Chernobyl have created worldwide concern over the risks involved in operating hazardous plants. Thorough procedures for the assessment and reliability testing of safety systems are now in great demand. *Reliability and Risk Assessment* provides a full theoretical background to the techniques used in this field of engineering and discusses how these methods are applied in practice. The authors show how these methods can be used to improve not only the safety records but also the efficiency, productivity, and profitability of processing plants. *Reliability and Risk Assessment* is intended primarily as a reference for professional engineers but will also prove invaluable for postgraduate students involved in reliability and risk assessment research.
