

### 5.1 Introduction to fiber optics

An optical fiber is a hair thin cylindrical fiber made of glass or any transparent dielectric material. It is used for optical communication as a waveguide. It transmits signals in form of light. The optical fiber optical communication system is shown in Fig 5.1.

Fig.5.1 optical fiber optical communication system

Optical fiber is backbone of communication system it carry a signal with a speed up to 1Tbit/sec or 100 million conversation simultaneously.

#### 5.1.1 Structure of optical fiber

**Core-** Central tube of very thin size made up of optically transparent dielectric medium and carries the light form transmitter to receiver.

**Cladding-** Outer optical material surrounding the core having refractive index lower than core. It helps to keep the light within the core throughout the phenomena of total internal reflection.

## **Engineering Physics Notes For Fibre Optics:**

*Wavelength Filters in Fibre Optics* Herbert Venghaus, 2006-09-21 Information and communication technologies have been growing and developing steadily for as long as any of us can remember. Growth was particularly strong in the last few decades and fibre optic communication systems have become predominant whenever information is to be transmitted over medium or long distances. Even when the telecommunication bubble burst at the beginning of the new millennium, the only thing which vanished was the expectation of making a fortune by buying and reselling telecom devices and equipment manufacturing companies. The upgrading of existing fibre optic links and the deployment of new ones continued unabated. The reason for the predominance of communication via optical fibres is the vast amount of information a single fibre can carry. However, in order to take advantage of this potential, it is mandatory to transmit different wavelength channels simultaneously over a single optical fibre, and the handling of these wavelength channels requires wavelength selective devices or wavelength filters. Among the functionalities optical filters have to accomplish are the selection of single or several channels out of a larger number of channels, the separation of one channel wavelength from unwanted spurious noise at different wavelengths, filters have to support routing, enable the lossless or low loss combination of wavelengths, and they have to compensate for wavelength dispersion effects. **European Scientific Notes**, 1990 Developments in Heat

**Fiber-Optic Communication Systems** Govind P. Agrawal, 1997 A complete up-to-date review of fiber optic communication systems theory and practice. Fiber optic communication systems technology continues to evolve rapidly. In the last five years alone, the bit rate of commercial point-to-point links has grown from 2.5 Gb/s to 40 Gb/s, and that figure is

expected to more than double over the next two years Such astonishing progress can be both inspiring and frustrating for professionals who need to stay abreast of important new developments in the field Now Fiber Optic Communication Systems Second Edition makes that job a little easier Based on its author s exhaustive review of the past five years of published research in the field this Second Edition like its popular predecessor provides an in depth look at the state of the art in fiber optic communication systems While engineering aspects are discussed the emphasis is on a physical understanding of this complex technology from its basic concepts to the latest innovations Thoroughly updated and expanded Fiber Optic Communication Systems Second Edition Includes 30% more information including four new chapters focusing on the latest lightwave systems R D Covers fundamental aspects of lightwave systems as well as a wide range of practical applications Functions as both a graduate level text and a professional reference Features extensive references and chapter end problem sets *Engineering Physics Part - I, 1/e* Selladurai, **European Science Notes**, 1987 **Scientific and Technical**
