Immunoematology: Principles and Practice Eva D Quinley,2020-06-15 Immunoematology Principles and Practice Third Edition an ideal text for anyone who wants to master the theory and practices of today s blood banking **Antibody Repertoire and Graft Outcome Following Solid Organ Transplantation** Narinder K. Mehra,Ajay Kumar Baranwal,Brian D. Tait,2017-07-25 The first real major breakthrough that laid the basis of HLA antibody detection in the field of solid organ transplantation came with the introduction of the complement dependent cytotoxicity CDC test in 1964 by Terasaki and McClelland Since then methods for antibody detection have evolved remarkably from conventional cell based assays to the current advanced solid phase systems on the Luminex platform with increasing degree of sensitivity and specificity The latter have been indispensable for more accurate identification of donor specific HLA antibodies in broadly reactive allo antisera and to guide donor selection and kidney paired exchange programs through virtual crossmatching in addition to serving as excellent tools for initiating pre transplant desensitization and post transplant antibody monitoring Consensus is evolving on the optimal routine employment of these methods in donor selection strategies along with an understanding of the clinical relevance of antibodies detected by each of them The immunoassays based on the Luminex platform and flow cytometric beads are however unable to discriminate complement fixing from non complement fixing HLA antibodies This is important because the former are considered clinically more pertinent in the peri transplant period The C1q assay which is a modification of the solid phase assay based on Luminex single antigen beads which can be used effectively to monitor high dose IVIG desensitization is essentially a surrogate complement fixing assay retaining the exquisite sensitivity and specificity of the Luminex platform Currently information obtained from these assays is preliminary and much needs to be done to standardize technologies and set a consensus MFI cut off for antibody positivity Besides the overriding influence of anti HLA antibodies on overall solid organ graft survival immune response to non HLA antigens has become a topic of substantial interest in recent years An ever expanding list of non HLA antigens has been implicated in graft rejection for various organs of which the most noted are the Major Histocompatibility Complex class I chain related molecule A MICA Vimentin Myosin Angiotensin II type 1 receptor AT1R Tubulin and Collagen MICA is one of the most polymorphic and extensively studied non HLA antigenic targets especially in renal transplantation Although there are clear indications of MICA antibodies being associated with adverse graft outcome to date a definitive consensus on this relationship has not been agreed Because MICA molecules are not expressed constitutively on immunocompetent cells such as T and B lymphocytes it is of utmost importance to address the impact of MICA donor specific antibodies DSA as compared to those that are non donor specific NDSA on graft outcome The soluble isoform of MICA molecule sMICA that is derived from the proteolytic shedding of membrane bound molecules has the potential to engage the NK cell activating receptor NKG2D and down regulate its expression Consequent to the interaction of NKG2D by sMICA the receptor ligand complex is endocytosed and degraded and thus suppresses

NKG2D mediated lysis of the target by NK cells Thus interaction between NKG2D and sMICA leads to expansion of immunosuppressive anergic T cells thereby resulting in suppression of NKG2D mediated host innate immunity These concept support the possible involvement of an immunosuppressive role for sMICA during allotransplantation as shown recently for heart transplantation This research topic focusses on the clinical utility of investigating the complete antibody repertoire in solid organ transplantation

Mire-Sluis, 2003 Immune responses to biological products have occurred with many approved therapeutics The proportion of patients mounting an immune response is product dependent and the clinical significance of the immune response also varies with the nature of the product Some products can induce production of significant levels of antibodies without any detectable effect on the activity of the product However neutralizing antibodies can attenuate the efficacy of the treatment and significant adverse clinical events can be seen if neutralizing antibodies cross react with patients endogenous proteins Prediction of immunogenicity includes the use of bio informatics to predict T cell epitopes T cell stimulation assays and in vivo transgenic animal models Approaches to prevent immunogenicity involve methods to design out immunogenic sequences protein pegylation and inducing tolerance Current methods for assessing and detecting immunogenicity include in vivo animal models antibody

assays and biological assays The advantages and disadvantages of the various methods illustrate that a battery of tests is required to appropriately monitor patients immune responses during clinical trials AIDS Research and Human Retroviruses ,1996
