

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the ends of a shaft to allow relative movement. These consist of 2 gaskets which distribute axial forces in a gasket with an application on all shafts and shaft assemblies used to rotate the shaft. A gasket is used to maintain the pressure in a shaft or a barrel throughout the life cycle application. The gasket compresses the shaft components between the mating surfaces of the shaft. This is done by creating a radial force on the shaft. The gasket is used to seal the shaft between the mating surfaces. If the gasket is not installed correctly for axial and rotational through the life of the application then it will be replaced by a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to be used in the shaft. Every gasket application or design has its own requirements therefore that must be addressed by specifying the performance of what the gasket is required to do in the application.
