Schapire, Yoav Freund, 2012-05-18 An accessible introduction and essential reference for an approach to machine learning that creates highly accurate prediction rules by combining many weak and inaccurate ones Boosting is an approach to machine learning based on the idea of creating a

highly accurate predictor by combining many weak and inaccurate rules of thumb. A remarkably rich theory has evolved around boosting with connections to a range of topics including statistics, game theory, convex optimization, and information geometry. Boosting algorithms have also enjoyed practical success in such fields as biology, vision, and speech processing. At various times in its history, boosting has been perceived as mysterious, controversial, even paradoxical. This book, written by the inventors of the method, brings together, organizes, simplifies, and substantially extends two decades of research on boosting, presenting both theory and applications in a way that is accessible to readers from diverse backgrounds while also providing an authoritative reference for advanced researchers. With its introductory treatment of all material and its inclusion of exercises in every chapter, the book is appropriate for course use as well. The book begins with a general introduction to machine learning algorithms and their analysis, then explores the core theory of boosting, especially its ability to generalize, examines some of the myriad other theoretical viewpoints that help to explain and understand boosting, provides practical extensions of boosting for more complex learning problems, and finally presents a number of advanced theoretical topics. Numerous applications and practical illustrations are offered throughout.

Machine Learning for Complex and Unmanned Systems Jose Martinez-Carranza, Everardo Inzunza-Gonzalez, Enrique Efrén

García-Guerrero, Esteban Tlelo-Cuautle, 2024-02-21 This book highlights applications that include machine learning methods to enhance new developments in complex and unmanned systems. The contents are organized from the applications requiring few methods to the ones combining different methods, and discussing their development and hardware/software implementation. The book includes two parts: the first one collects machine learning applications in complex systems, mainly discussing developments, highlighting their modeling and simulation, and hardware implementation. The second part collects applications of machine learning in unmanned systems, including optimization and case studies in submarines, drones, and robots. The chapters discuss miscellaneous applications required by both complex and unmanned systems in the areas of artificial intelligence, cryptography, embedded hardware, electronics, the Internet of Things, and healthcare. Each chapter provides guidelines and details of different methods that can be reproduced in hardware, software, and discusses future research. Features: Provides details of applications using machine learning methods to solve real problems in engineering. Discusses new developments in the areas of complex and unmanned systems. Includes details of hardware/software implementation of machine learning methods. Includes examples of applications of different machine learning methods for

future lines for research in the hot topic areas of submarines drones robots cryptography electronics healthcare and the Internet of Things This book can be used by graduate students industrial and academic professionals to examine real case studies in applying machine learning in the areas of modeling simulation and optimization of complex systems cryptography electronics healthcare control systems Internet of Things security and unmanned systems such as submarines drones and robots
