**Canadian Journal of Electrical and Computer Engineering**, 1994 [Laser-Matter Interaction for Radiation and Energy](#) Hitendra K. Malik, 2021-03-14 The interaction of high-power lasers with matter can generate Terahertz radiations that efficiently contribute to THz Time Domain Spectroscopy and also would replace X-rays in medical and security applications. When a short intense laser pulse ionizes a gas, it may produce new frequencies even in VUV to XUV domain. The duration of XUV pulses can be confined down to the isolated attosecond pulse levels required to study the electronic re-arrangement and ultrafast processes. Another important aspect of laser-matter interaction is the laser thermonuclear fusion control, where accelerated particles also find an efficient use. This book provides comprehensive coverage of the most

essential topics including Electromagnetic waves and lasers THz radiation using semiconducting materials nanostructures gases plasmas Surface plasmon resonance THz radiation detection Particle acceleration technologies X ray lasers High harmonics and attosecond lasers Laser based techniques of thermonuclear fusion Controlled fusion devices including NIF and ITER The book comprises of 11 chapters and every chapter starts with a lucid introduction to the main topic Then sub topics are sedulously discussed keeping in mind their basics methodology state of the art and future perspective that will prove to be salutary for readers High quality solved examples are appended to the chapters for their deep understanding and relevant applications In view of the nature of the topics and their level of discussion this book is expected to have pre eminent potential for researchers along with postgraduate and undergraduate students all over the world

Bekey,2012-12-06 All life came from sea but all robots were born on land The vast majority of both industrial and mobile robots operate on land since the technology to allow them to operate in and under the ocean has only become available in recent years A number of complex issues due to the unstructured hazardous undersea environment makes it difficult to travel in the ocean while today s technologies allow humans to land on the moon and robots to travel to Mars Clearly the obstacles to allowing robots to operate in a saline aqueous and pressurized environment are formidable Mobile robots operating on

land work under nearly constant atmospheric pressure their legs or wheels or tracks can operate on a firm footing their bearings are not subjected to moisture and corrosion they can use simple visual sensing and be observed by their creators working in simple environments In contrast consider the environment where undersea robots must operate The pressure they are subjected to can be enormous thus requiring extremely rugged designs The deep oceans range between 19 000 to 36 000 ft At a mere 33 foot depth the pressure will be twice the normal one atmosphere pressure of 29.4 psi The chemical environment of the sea is highly corrosive thus requiring the use of special materials Lubrication of moving parts in water is also difficult and may require special sealed waterproof joints
