High-Power Fiber Lasers for Directed-Energy

Applications, 2008 High power fiber lasers can be incoherently combined to form the basis of a high energy laser system for directed energy applications These applications include tactical directed energy and power beaming Incoherent combining of fiber lasers has a number of advantages over other laser beam combining methods The incoherently combined laser system is relatively simple highly efficient compact robust low maintenance and reliable In this article we characterize the atmospheric propagation of incoherently combined high optical quality laser beams and compare them with other types of laser beams and combining methods For tactical directed energy applications we find that the propagation efficiency of incoherently combined high optical quality beams is near the theoretical upper limit for any laser system with the same beam director and total power We present results of the first atmospheric propagation experiments using incoherently combined kilowatt class single mode fiber lasers These NRL field experiments combined four fiber lasers using a beam director consisting of individually controlled steering mirrors The transmitted continuous wave power was 3 kW at a range of 1.2 km with a demonstrated propagation efficiency of $\sim 90\%$ in moderate atmospheric turbulence The experimental results are found to be in good agreement with simulations and theory
