

# Human Genetics Lab

**Exploring Human Genetics**

For this lab, you will be working with a set of data from a genetic cross. The data is presented in a table below. You will be using this data to calculate the chi-square value and determine if the results are significant.

**Background:**

The following table shows the results of a genetic cross between two heterozygous individuals (AaBb x AaBb). The traits are flower color (A) and seed shape (B).

Phenotype	Number of Offspring	Expected Number
Red flowers, round seeds	31	31.25
Red flowers, wrinkled seeds	33	31.25
White flowers, round seeds	35	31.25
White flowers, wrinkled seeds	31	31.25
<b>Total</b>	<b>130</b>	<b>130</b>

**Procedure:**

1. Calculate the chi-square value using the formula:  $\chi^2 = \sum \frac{(O - E)^2}{E}$

2. Determine the degrees of freedom (df) for the test.

3. Compare the calculated chi-square value to the critical value from the chi-square distribution table.

4. Interpret the results: If the calculated value is greater than the critical value, the results are significant. If it is less, the results are not significant.

Collect data and complete chi square analysis
