Abstract

We discuss the linearization of a non-autonomous nonlinear partial difference equation belonging to the Bell classification of quad-graph equations consistent around the cube. We show that its Lax pair is fake. We present its generalized symmetries which turn out to be non-autonomous and depending on an arbitrary function of the dependent variables defined in two lattice points. These generalized symmetries are differential difference equations which, in some case, admit peculiar Bäcklund transformations.

1 Introduction.

Symmetries and commuting flows have been in a way or in another at the base of integrability. Bäcklund transformations and nonlinear superposition rules [22, 29] paved the way to the discretization of integrable systems.

A first version of the integrability criteria denoted Consistency Around the Cube (CAC) can be found in the work of Doliwa and Santini [13].

In recent years CAC has been a source of many results in the classification of nonlinear difference equations. Its importance relies in the fact that provides Bäcklund transforms [7, 11, 27, 28] and as a consequence the existence of a zero curvature representation or Lax pairs, which, as it is well known [36] are associated to both linearizable and integrable equations.

The first attempt to carry out a classification of partial difference equations using the CAC condition has been presented in [1] assuming that the equations on all faces of the cube were the same form. The result is a class of discrete equations formed by systems living on quad-graphs, whose basic building blocks are equations on quadrilaterals of the type

$$A(x, x_1, x_2, x_{12}; \alpha_1, \alpha_2) = 0, \quad (1)$$

Linearizability And A Fake Lax Pair For A Nonlinear:

Asymptotic, Algebraic and Geometric Aspects of Integrable Systems Frank Nijhoff, Yang Shi, Da-jun Zhang, 2020-10-23

This proceedings volume gathers together selected works from the 2018 Asymptotic Algebraic and Geometric Aspects of Integrable Systems workshop that was held at TSIMF Yau Mathematical Sciences Center in Sanya China honoring Nalini Joshi on her 60th birthday. The papers cover recent advances in asymptotic algebraic and geometric methods in the study of discrete integrable systems. The workshop brought together experts from fields such as asymptotic analysis, representation theory and geometry, creating a platform to exchange current methods, results and novel ideas. This volume's articles reflect these exchanges and can be of special interest to a diverse group of researchers and graduate students interested in learning about current results, new approaches and trends in mathematical physics, in particular those relevant to discrete integrable systems. [Continuous Symmetries and Integrability of Discrete Equations](#) Decio Levi, Pavel Winternitz, Ravil I.

Yamilov, 2023-01-23 This book on integrable systems and symmetries presents new results on applications of symmetries and integrability techniques to the case of equations defined on the lattice. This relatively new field has many applications, for example in describing the evolution of crystals and molecular systems defined on lattices and in finding numerical approximations for differential equations preserving their symmetries. The book contains three chapters and five appendices. The first chapter is an introduction to the general ideas about symmetries, lattices, differential, difference and partial difference equations and Lie point symmetries defined on them. Chapter 2 deals with integrable and linearizable systems in two dimensions. The authors start from the prototype of integrable and linearizable partial differential equations, the Korteweg-de Vries and the Burgers equations. Then they consider the best known integrable differential, difference and partial difference equations. Chapter 3 considers generalized symmetries and conserved densities as integrability criteria. The appendices provide details which may help the readers' understanding of the subjects presented in Chapters 2 and 3. This book is written for PhD students and early researchers both in theoretical physics and in applied mathematics who are interested in the study of symmetries and integrability of difference equations. This book shows how Lie group and integrability techniques originally developed for differential equations have been adapted to the case of difference equations. Difference equations are playing an increasingly important role in the natural sciences. Indeed, many phenomena are inherently discrete and thus naturally described by difference equations. More fundamentally, in subatomic physics, space-time may actually be discrete. Differential equations would then just be approximations of more basic discrete ones. Moreover, when using differential equations to analyze continuous processes, it is often necessary to resort to numerical methods. This always involves a discretization of the differential equations involved, thus replacing them by difference ones. Each of the nine peer-reviewed chapters in this volume serves as a self-contained treatment of a topic, containing introductory material as well as

the latest research results and exercises Each chapter is presented by one or more early career researchers in the specific field of their expertise and in turn written for early career researchers As a survey of the current state of the art this book will serve as a valuable reference and is particularly well suited as an introduction to the field of symmetries and integrability of difference equations Therefore the book will be welcomed by advanced undergraduate and graduate students as well as by more advanced researchers
