Organic Chemistry Education Research into Practice Jay

Wackerly, Sarah Zingales, Michael Wentzel, Gautam Bhattacharyya, Brett McCollum, 2025-03-25 This Research Topic has three main goals 1 provide a platform for instructors of organic chemistry to showcase evidence based methods and educational theories they have utilized in their classrooms 2 build new and strengthen existing connections between educational researchers and practitioners and 3 highlight how people have used chemical education based research in their teaching practice There are places in the literature dedicated for chemical education research CER however there is not a clear avenue for those that have changed their teaching methods based on published CER and report their experiences Creating this article collection will foster collaboration between chemical education researchers and teachers of organic chemistry This opportunity allows these instructors to share evidence based practices experiences challenges and innovative approaches from CER literature and beyond This Research Topic bridges discipline based education research and the scholarship of teaching and learning which will help advance organic chemistry education and improve student outcomes

Preparing for Your ACS Examination in Organic Chemistry Examinations Institute-American Chemical Society Division of Chemical Education, 2019-12 Organic Chemistry Study Guide In-situ and In-operando Techniques for Material Characterizations during Battery Operation, 2nd edition Veronica Palomares, Neeraj Sharma, 2023-06-07 Battery material research has been one of the major areas of study in the last 30 years due to the huge impact of battery technology in our

daily lives Both the discovery of new materials and their electrochemical optimization requires an in depth and fundamental understanding of the composition and structure at different length scales Local long range structure polymorphism microstructure composite formulation and nanoscale engineering all contribute to a materials innate ability to deliver the best performance as an electrode in a battery Importantly the evolution of all these components during battery function determine essentially all the pertinent battery characteristics such as lifetime and energy storage density For these reasons it is critical to determine materials structure at various length scales in order to be able to predict or understand their properties and propose changes to improve their electrochemical behavior In this sense conventional characterization techniques of the material itself are very useful in the first stages of research but in many cases the use of in situ or in operando characterization techniques provides a unique way of understanding materials performance or evolution during battery operation The challenge becomes greater in terms of experimental design because these techniques involve devising and fabricating specific electrochemical cells that fulfill the requirements of the technique but deliver electrochemical performance akin to a real life device

Approaching human intelligence through chemical systems: Development of unconventional chemical artificial intelligence Pier Luigi Gentili,Konrad Szaciłowski,Andrew Adamatzky,2023-11-27 Although human intelligence is deeply investigated by neuroscientists psychologists philosophers and AI researchers we still lack of a

widely accepted definition of what it is If we exploit the emergence theory from Complexity Science to give a definition we might state that human intelligence is the emergent property of the human nervous system Such fascinating emergent property allows us to handle both accurate and vague information by computing with numbers and words Moreover it allows us to reason speak and take rational decisions in an environment of uncertainty partiality and relativity of truth when the Incompatibility Principle holds As the complexity of a system increases accuracy and significance become almost mutually exclusive characteristics of our statements Finally our intelligence allows us recognizing quite easily variable patterns Therefore it is worthwhile investigating human intelligence and trying to mimic it by developing Artificial Intelligence Nowadays Artificial Intelligence is in vogue it is applied in both basic and applied science Traditionally there are two strategies to develop Artificial Intelligence A strategy consists in writing human like intelligent software running in von Neumann computers or special purpose hardware The other strategy consists in neuromorphic engineering Neuromorphic engineering implements surrogates of neurons through non biological systems either for neuro prosthesis or to design brain like computing machines A third strategy is now blooming and it consists in using molecular supramolecular materials and systems chemistry to mimic some basic functions of human intelligence such as Boolean multi valued logic gates and Fuzzy logic This third strategy is originating Chemical Artificial Intelligence CAI A relevant purpose of CAI is to design modules for Chemical Robots A Chemical Robot is thought of as a molecular assembly that reacts autonomously to its environment by probing it with molecular sensors making decisions by its intrinsic Artificial Neural Networks or logic gates and performing actions upon its environment through molecular effectors The intelligent activities of any Chemical Robot should be sustained energetically by a metabolic unit Chemical Robots should be easily miniaturized and implanted in living beings to interplay with cells or organelles for biomedical applications They should become auxiliary elements of the natural immune system
