Combinatorial Matrix Classes Richard A. Brualdi, 2006-08-10 A natural sequel to the author's previous book *Combinatorial Matrix Theory* written with H J Ryser this is the first book devoted exclusively to existence questions constructive algorithms enumeration questions and other properties concerning classes of matrices of combinatorial significance Several classes of matrices are thoroughly developed including the classes of matrices of 0's and 1's with a specified number of 1's in each row and column equivalently bipartite graphs with a specified degree sequence symmetric matrices in such classes equivalently graphs with a specified degree sequence tournament matrices with a specified number of 1's in each row equivalently tournaments with a specified score sequence nonnegative matrices with specified row and column sums and doubly stochastic matrices Most of this material is presented for the first time in book format and the chapter on doubly stochastic matrices provides the most complete development of the topic to date *Combinatorial Matrix Classes* Richard A Brualdi, 2014-05-14 A thorough development of certain classes of matrices that have combinatorial definitions or significance *Combinatorial Matrix Theory* Richard A. Brualdi, Angeles Carmona, P. van den Driessche, Stephen Kirkland, Dragan Stevanović, 2018-03-31 This book contains the notes of the lectures delivered at an Advanced Course on Combinatorial Matrix Theory held at Centre de Recerca Matemàtica CRM in Barcelona These notes correspond to five series of lectures The first series is dedicated to the study of several matrix classes defined combinatorially and was delivered by Richard A Brualdi The second one given by Pauline van den Driessche is concerned with the study of spectral properties of matrices with a given sign pattern Dragan Stevanović delivered the third one devoted to describing the spectral radius of a graph as a tool to provide bounds of parameters related with properties of a graph The fourth lecture was delivered by Stephen Kirkland and is dedicated to the applications of the Group Inverse of the Laplacian matrix The last one given by Angeles Carmona focuses on boundary value problems on finite networks with special in depth on the M matrix inverse problem *Combinatorial Matrix Theory* Richard A. Brualdi, 1991 This is the first book devoted to the exposition of combinatorial matrix theory It can be used as a graduate course text but is complete enough for a standard reference work on the basic theory **Convex Optimization & Euclidean Distance Geometry** Jon Dattorro, 2005 The study of Euclidean distance matrices EDMs fundamentally asks what can be known geometrically given only distance information between points in Euclidean space Each point may represent simply location or abstractly any entity expressible as a vector in finite dimensional Euclidean space The answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep Throughout we cite beacons of historical accomplishment The application of EDMs has already proven invaluable in discerning biological molecular conformation The emerging practice of localization in wireless sensor networks the global positioning system GPS and distance based pattern recognition will certainly simplify and benefit from this theory We study the pervasive convex

Euclidean bodies and their various representations In particular we make convex polyhedra cones and dual cones more visceral through illustration and we study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion We explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals The conic analogue to linear independence called conic independence is introduced as a new tool in the study of classical cone theory the logical next step in the progression linear affine conic Any convex optimization problem has geometric interpretation This is a powerful attraction the ability to visualize geometry of an optimization problem We provide tools to make visualization easier The concept of faces extreme points and extreme directions of convex Euclidean bodies is explained here crucial to understanding convex optimization The convex cone of positive semidefinite matrices in particular is studied in depth We mathematically interpret for example its inverse image under affine transformation and we explain how higher rank subsets of its boundary united with its interior are convex The Chapter on Geometry of convex functions observes analogies between convex sets and functions The set of all vector valued convex functions is a closed convex cone Included among the examples in this chapter we show how the real affine function relates to convex functions as the hyperplane relates to convex sets Here also pertinent results for multidimensional convex functions are presented that are largely ignored in the literature tricks and tips for determining their convexity and discerning their geometry particularly with regard to matrix calculus which remains largely unsystematized when compared with the traditional practice of ordinary calculus Consequently we collect some results of matrix differentiation in the appendices The Euclidean distance matrix EDM is studied its properties and relationship to both positive semidefinite and Gram matrices We relate the EDM to the four classical axioms of the Euclidean metric thereby observing the existence of an infinity of axioms of the Euclidean metric beyond the triangle inequality We proceed by deriving the fifth Euclidean axiom and then explain why furthering this endeavor is inefficient because the ensuing criteria while describing polyhedra grow linearly in complexity and number Some geometrical problems solvable via EDMs EDM problems posed as convex optimization and methods of solution are presented eg we generate a recognizable isotonic map of the United States using only comparative distance information no distance information only distance inequalities We offer a new proof of the classic Schoenberg criterion that determines whether a candidate matrix is an EDM Our proof relies on fundamental geometry assuming any EDM must correspond to a list of points contained in some polyhedron possibly at its vertices and vice versa It is not widely known that the Schoenberg criterion implies nonnegativity of the EDM entries proved here We characterize the eigenvalues of an EDM matrix and then devise a polyhedral cone required for determining membership of a candidate matrix in Cayley Menger form to the convex cone of Euclidean distance matrices EDM cone ie a candidate is an EDM if and only if its eigenspectrum belongs to a spectral cone for EDM N We will see spectral cones are not

unique In the chapter EDM cone we explain the geometric relationship between the EDM cone two positive semidefinite cones and the ellipsope We illustrate geometric requirements in particular for projection of a candidate matrix on a positive semidefinite cone that establish its membership to the EDM cone The faces of the EDM cone are described but still open is the question whether all its faces are exposed as they are for the positive semidefinite cone The classic Schoenberg criterion relating EDM and positive semidefinite cones is revealed to be a discretized membership relation a generalized inequality a new Farkas like lemma between the EDM cone and its ordinary dual A matrix criterion for membership to the dual EDM cone is derived that is simpler than the Schoenberg criterion We derive a new concise expression for the EDM cone and its dual involving two subspaces and a positive semidefinite cone Semidefinite programming is reviewed with particular attention to optimality conditions of prototypical primal and dual conic programs their interplay and the perturbation method of rank reduction of optimal solutions extant but not well known We show how to solve a ubiquitous platonic combinatorial optimization problem from linear algebra the optimal Boolean solution x to $Ax \leq b$ via semidefinite program relaxation A three dimensional polyhedral analogue for the positive semidefinite cone of 3×3 symmetric matrices is introduced a tool for visualizing in 6 dimensions In EDM proximity we explore methods of solution to a few fundamental and prevalent Euclidean distance matrix proximity problems the problem of finding that Euclidean distance matrix closest to a given matrix in the Euclidean sense We pay particular attention to the problem when compounded with rank minimization We offer a new geometrical proof of a famous result discovered by Eckart Young in 1936 regarding Euclidean projection of a point on a subset of the positive semidefinite cone comprising all positive semidefinite matrices having rank not exceeding a prescribed limit ρ We explain how this problem is transformed to a convex optimization for any rank ρ Combinatorial Matrix Theory

Richard A. Brualdi, Herbert John Ryser, 2014-05-14 This book first published in 1991 is devoted to the exposition of combinatorial matrix theory **The Mutually Beneficial Relationship of Graphs and Matrices** Richard A.

Brualdi, 2011-07-06 Graphs and matrices enjoy a fascinating and mutually beneficial relationship This interplay has benefited both graph theory and linear algebra In one direction knowledge about one of the graphs that can be associated with a matrix can be used to illuminate matrix properties and to get better information about the matrix Examples include the use of digraphs to obtain strong results on diagonal dominance and eigenvalue inclusion regions and the use of the Rado Hall theorem to deduce properties of special classes of matrices Going the other way linear algebraic properties of one of the matrices associated with a graph can be used to obtain useful combinatorial information about the graph The adjacency matrix and the Laplacian matrix are two well known matrices associated to a graph and their eigenvalues encode important information about the graph Another important linear algebraic invariant associated with a graph is the Colin de Verdiere number which for instance characterizes certain topological properties of the graph This book is not a comprehensive study of graphs and matrices The particular content of the lectures was chosen for its accessibility beauty and current relevance

and for the possibility of enticing the audience to want to learn more Combinatorics and Graphs Richard A. Brualdi, 2010 This volume contains a collection of papers presented at the international conference IPM 20 Combinatorics 2009 which was held at the Institute for Research in Fundamental Sciences in Tehran Iran May 15 21 2009 The conference celebrated IPM s 20th anniversary and was dedicated to Reza Khosrovshahi one of the founders of IPM and the director of its School of Mathematics from 1996 to 2007 on the occasion of his 70th birthday The conference attracted an international group of distinguished researchers from many different parts of combinatorics and graph theory including permutations designs graph minors graph coloring graph eigenvalues distance regular graphs and association schemes hypergraphs and arrangements This volume contains a collection of papers presented at the international conference IPM 20 Combinatorics 2009 which was held at the Institute for Research in Fundamental Sciences in Tehran Iran May 15 21 2009 The conference celebrated IPM s 20th anniversary and was dedicated to Reza Khosrovshahi one of the founders of IPM and the director of its School of Mathematics from 1996 to 2007 on the occasion of his 70th birthday The conference attracted an international group of distinguished researchers from many different parts of combinatorics and graph theory including permutations designs graph minors graph coloring graph eigenvalues distance regular graphs and association schemes hypergraphs and arrangements

The Complexity of Logarithmic Space Bounded Counting Classes (Second Edition) T. C. Vijayaraghavan, 2026-03-10 A logarithmic space bounded counting class is defined based on the number of accepting and or the number of rejecting computation paths of a NL Turing machine This monograph gives a nice in depth exposition of logarithmic space bounded counting classes and many important results on them including their properties A major portion of results shown by the author have not appeared in any textbook on computational complexity This textbook is intended to be an introductory material on logarithmic space bounded counting classes for advanced undergraduate students or graduate students and researchers who have prior knowledge of basic concepts in the Design and Analysis of Algorithms Theory of Computation Computational Complexity and Discrete Mathematics
