

How Can Blood Diseases Be Identified?

Blood is a tissue. It has many different cells with many different jobs. If you look at blood under microscope, you will find three different cell types – red cells, white cells, and platelets. In a normal person the numbers of types of blood cells are fairly constant. Sometimes, however, the number of cells will change due to a certain disease. Noticing this change in number can help a physician in the diagnosis of a person's disease.

BACKGROUND – Define the following words:

Diagnosis

Platelet

Red blood cell

White blood cell

PROCEDURE

Part A. Normal Blood Cells

- Examine Figure 1, which shows human blood cells magnified 1000 times.
- Count cell type present.
 - Red blood cells – round, very numerous, no nucleus
 - White blood cells – round, few in number, larger than red blood cells, nucleus present
 - Platelets – dotlike, many but less than red cells, very small
- Record the number of each cell type for Figure 1 in Table 1. These numbers are for normal blood.
- Using the numbers 1, 2, 3, rank the cells in order from the most common (1) to the least common (3). Enter these rankings in the next column in Table 1 marked Rank.
