

Chapter 3: Cell Structure and Function

Cell theory and the development of microscopy:

- ◆ Cell theory states that all living organisms are composed of cells, cells are the basic units of structure and function in living organisms, and cells arise from pre-existing cells.
- ◆ The development of microscopy, particularly the invention of the compound microscope, allowed for the observation and study of cells.

Prokaryotic and eukaryotic cells:

- ◆ Prokaryotic cells are simpler and lack a membrane-bound nucleus and membrane-bound organelles. They include bacteria and archaea.
- ◆ Eukaryotic cells are more complex, with a membrane-bound nucleus and various membrane-bound organelles. They make up plants, animals, fungi, and protists.

Cell organelles and their functions:

- ◆ **Nucleus:** Contains DNA and controls cell activities.
- ◆ **Mitochondria:** Site of cellular respiration and energy production.
- ◆ **Endoplasmic reticulum:** Involved in protein and lipid synthesis.
- ◆ **Golgi apparatus:** Modifies, sorts, and packages proteins for transport.
- ◆ **Lysosomes:** Digests waste materials and cellular debris.
- ◆ **Chloroplasts:** Site of photosynthesis in plant cells.
- ◆ **Central vacuole:** Maintains turgor pressure in plant cells.
- ◆ **Cell membrane:** Regulates the movement of substances into and out of the cell.

Cell membrane structure and transport mechanisms:

- ◆ The cell membrane is composed of a phospholipid bilayer with embedded proteins and other molecules.
- ◆ It controls the movement of substances through various mechanisms, including diffusion, osmosis, facilitated diffusion, active transport, and endocytosis/exocytosis.

Fundamentals of Applied Entomology Robert E. Pfadt, 1971 **Fundamentals of Applied Entomology**, 1962 **The Extended Organism** J. Scott Turner, 2009-06-01 Can the structures that animals build from the humble burrows of earthworms to towering termite mounds to the Great Barrier Reef be said to live However counterintuitive the idea might first seem physiological ecologist Scott Turner demonstrates in this book that many animals construct and use structures to harness and control the flow of energy from their environment to their own advantage Building on Richard Dawkins s classic *The Extended Phenotype* Turner shows why drawing the boundary of an organism s physiology at the skin of the animal is arbitrary Since the structures animals build undoubtedly do physiological work capturing and channeling chemical and physical energy Turner argues that such structures are more properly regarded not as frozen behaviors but as external organs of physiology and even extensions of the animal s phenotype By challenging dearly held assumptions a fascinating new view of the living world is opened to us with implications for our understanding of physiology the environment and the remarkable structures animals build
