

When you are given a pedigree diagram of human pedigree with quantitative characters, remember that the mode of inheritance is not always dominant-recessive. It could be sex-linked. The following guidelines are helpful in solving such problems. In some, although uncommon, you will find the inheritance of dominant and recessive alleles controlled either by autosomal or sex-linked genes. When you are given a pedigree diagram, remember:

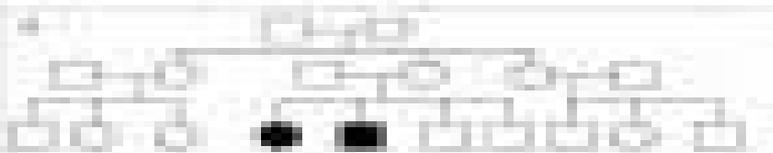

When the inheritance is autosomal:

<p>Recessive:</p> <ul style="list-style-type: none"> 1. Affected offspring with unaffected parents 2. Unaffected parents can not have affected offspring 	<p>Dominant:</p> <ul style="list-style-type: none"> 1. Every affected person has at least one affected parent 2. Two unaffected parents cannot have affected offspring
---	---

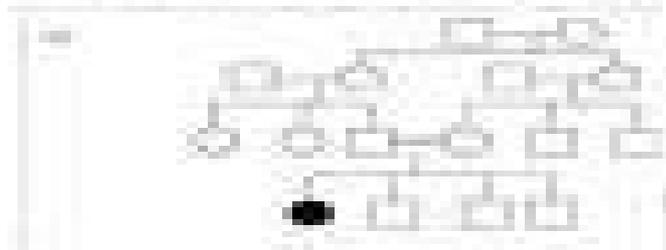

When the inheritance is sex-linked:

<p>Recessive:</p> <ul style="list-style-type: none"> 1. All affected individuals 2. Affected females' affected 3. Not every generation 	
--	--

1. In each of the pedigrees, identify the mode of inheritance & give the genotypes of the parents of the affected

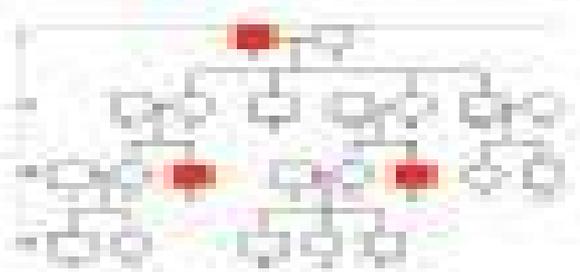

- 1. Autosomal recessive
- 2. Affected offspring (males & affected female)
- 3. Affected carrier (heterozygous) of affected male

- 1. sex-linked recessive
- 2. no affected carrier (heterozygous)
- 3. affected male with affected female (carrier)

- 1. Autosomal dominant
- 2. unaffected offspring and one affected parent
- 3. Affected carrier (heterozygous) of affected male
