Orthogonal frequency division multiplexing OFDM has become the foundation technique in modern broadband wireless communications such as wireless local area network WLAN IEEE 802.11a/g/n, wireless metropolitan area network WiMAX IEEE 802.16 and cellular network long term evolution LTE and 4G. However, future OFDM systems see challenging problems associated with increased data rate and signal bandwidth requirement. Signal with larger bandwidth not only leads to severer frequency domain channel fading but also imposes more constraints and challenges on hardware. For example, in multi-band OFDM UWB systems where the bandwidth of signal is more than 500MHz, analog to digital converter ADC becomes one of the bottlenecks of system development. Spectrum efficiency becomes more important due to the scarce spectrum resource and increased bandwidth requirement. OFDM improves spectrum efficiency by removing the guard band required in conventional frequency division systems, however, the temporal guarding interval used in OFDM is questioned as a factor that reduces spectrum efficiency. Some alternative approaches have been investigated to reduce the overhead, for example, the pseudo random prefix PRP. One better way of improving spectrum efficiency is to apply resource optimization techniques which assign system resources to users adaptively according to users' link requirements and channel conditions. Spatial division multiple access SDMA as an extension of the optimization technique to multi-access systems exploits spacial redundancy and significantly increases system capacity. This thesis investigates several solutions for these challenging problems with focus on addressing the difference between using zero padding and cyclic padding. ADC solution for signals with extremely large bandwidth and joint design of transmit and receive beamforming for SDMA systems. It is highlighted that timing error in zero padded OFDM system causes intercarrier interference which is very different to OFDM system with cyclic prefix where only phase rotation is arisen. Frequency channelized ADC is proposed for OFDM systems with very large bandwidth and receiver baseband implementation including synchronization and equalization is studied. The proposed receiver does not require a signal reconstruction module which was commonly needed in such systems. Some novel joint beamforming design schemes are proposed within the framework of multiuser multiple input multiple output systems following minimum mean square error MMSE criterion. In a SDMA system with codebook based channel feedback, the

proposed schemes can efficiently mitigate the multiuser interference due to the channel quantization error and speed up the searching process significantly

ABSTRACT With the increasing advancements in the digital technology future wireless systems are promising to support higher data rates higher mobile speeds and wider coverage areas among other features While further technological developments allow systems to support higher computational complexity lower power consumption and employ larger memory units other resources remain limited One such resource which is of great importance to wireless systems is the available spectrum for radio communications To be able to support high data rate wireless applications there is a need for larger bandwidths in the spectrum Since the spectrum cannot be expanded studies have been concerned with fully utilizing the available spectrum One approach to achieve this goal is to reuse the available spectrum through space time frequency and code multiplexing techniques Another approach is to optimize the transceiver design as to achieve the highest throughput over the used spectrum From the physical layer perspective there is a need for a highly flexible and efficient modulation technique to carry the communication signal A multicarrier modulation technique known as orthogonal frequency division multiplexing OFDM is one example of such a technique OFDM has been used in a number of current wireless standards such as wireless fidelity WiFi and worldwide interoperability for microwave access WiMAX standards by the Institute of Electrical and Electronics Engineers IEEE and has been proposed for future 4G technologies such as the long term evolution LTE and LTE advanced standards by the 3rd Generation Partnership Project 3GPP and the wireless world initiative new radio WINNER standard by the Information society technologies IST This is due to OFDM s high spectral efficiency resistance to narrow band interference support for high data rates adaptivity and scalability In this dissertation OFDM and multiuser OFDM also known as orthogonal frequency division multiple access OFDMA techniques are investigated as a candidate for advanced wireless systems Features and requirements of future applications are discussed in detail and OFDM s ability to satisfy these requirements is investigated We identify a number of challenges that when addressed can improve the performance and throughput of OFDM based systems The challenges are investigated over three stages In the first stage minimizing or avoiding the interference between multiple OFDMA users as well as adjacent systems is addressed An efficient algorithm for OFDMA uplink synchronization that maintains the orthogonality between multiple users is proposed For adjacent channel interference a new spectrum shaping method is proposed that can reduce the out of band radiation of OFDM signals Both methods increase the utilization of available spectrum and reduce interference between different users In the second stage the goal is to maximize the system throughput for a given available bandwidth The OFDM system performance is considered under practical channel conditions and the corresponding bit error rate BER expressions are derived Based on these results the optimum pilot insertion rate is investigated In addition a new pilot pattern that improves the system ability to estimate and equalize various radio frequency RF impairments is proposed In the last stage

acquiring reliable measurements regarding the received signal is addressed Error vector magnitude EVM is a common performance metric that is being used in many of today's standards and measurement devices Inferring the signal to noise ratio SNR from EVM measurements has been investigated for either high SNR values or data aided systems We show that using current methods does not yield reliable estimates of the SNR under other conditions Thus we consider the relation between EVM and SNR for nondata aided systems We provide expressions that allow for accurate SNR estimation under various practical channel conditions
