**Abstract:** In this paper, we applied the method of Double Laplace Transform for solving the one dimensional Boundary Value Problems. Through this method the boundary value problem is solved without converting it into Ordinary Differential equation, therefore no need to find complete solution of Ordinary Differential equation. This is the biggest advantage of this method. The scheme is tested through some examples & the results demonstrate reliability.

### 1. Introduction

Integral transforms [1, 2] are extensively used in solving boundary value problems & integral equations. The problem related to partial differential equation commonly can be solved by using a special integral transform thus many authors solved the boundary value problems by using single Laplace Transform [6]. The Wave equation, Heat equation & Laplace's equations as these fundamental equations in mathematical Physics & occur in many branches of Physics, in Applied mathematics as well as in Engineering. Elbayeb and Kilsamen [3] has worked on the non-homogeneous wave equation with variable coefficients is solved by applying the Double Laplace Transform.

In 1990 [4], R. S. Dubey & Vinayagomathy established several new theorems & corollaries for calculating Laplace Transforms pairs of n-dimensions. They also considered two boundary value problems. The first was related to heat transfer for cooling off a very thin semi-infinite homogeneous plate into the surrounding medium solved by using double Laplace Transforms, the second, was heat equation for the semi-infinite slab where the sides of the slab are maintained at prescribed temperature.

Recently in 2013 [5], Agbala & Moshahar have applied the Double Laplace Transform to solve second order Linear Differential equation with constant coefficients.

In this study, we use Double Laplace Transform to solve one dimensional boundary value problem, that is, Wave & Heat equation. Henceforth the different problems of boundary value is solved without converting it into Ordinary Differential Equation, & no need to find complete solution. So this method is very reliable & convenient for solving boundary value problem.

The scheme is tested through three different examples which are being referred from [7, 8].

#### Definition of double Laplace transform:

First of all, we recall the following definitions given by Estrin & Higgins [2].

Let  $f(x, t)$  be a function of two variables  $x$  and  $t$ , where  $x, t > 0$ . The double Laplace transform of  $f(x, t)$  is defined as

$$L_x L_t \{f(x, t)\} = \bar{f}(p, s) = \int_0^\infty e^{-st} \int_0^\infty e^{-px} f(x, t) dx dt \quad (1)$$

whenever the improper integral converges. Here  $p, s$  are complex numbers.

#### Existence of double Laplace transform:

Let  $f(x, t)$  be a continuous function on the interval  $(0, \infty)$  which is of exponential order, that is, for some  $a, b \in \mathbb{R}$ .

Consider  $\text{Sup}_{x,t>0} \frac{|f(x,t)|}{e^{ax+bt}} < \infty$

In this case, the double Laplace transform of  $f(x, t)$  that is

$$L_x L_t \{f(x, t)\} = \bar{f}(p, s) = \int_0^\infty e^{-st} \int_0^\infty e^{-px} f(x, t) dx dt$$

exists for all  $p > a$  &  $s > b$  & is in fact infinitely differentiable with respect to  $p > a$  &  $s > b$ .
