Abstract. A useful exact analytical solution of the Boussinesq equation is discussed and is the most general solution presently available, and in particular yields a solution for a finite aquifer. It provides insight into the physical processes arising during the exchange of water between an aquifer and a free body of water of varying height as an application and extension of Barenblatt's solution. We also illustrate the value of such a solution to check numerical and approximate schemes.

Key words: Boussinesq equation, exact solution, saturated flow, unsteady profiles, finite aquifers.

1. Introduction

The movement of water in an aquifer is represented by Boussinesq's equation,

$$\frac{\partial h}{\partial t} = \frac{K}{S} \frac{\partial}{\partial x} \left(h \frac{\partial h}{\partial x} \right), \quad (1)$$

where $h(x, t)$ represents the depth of the water table with respect to a horizontal impervious layer. The boundary conditions are given by $h(x, 0)$ and

$$h(0, t) = H(t), \quad (2)$$

$$\frac{\partial h}{\partial t}(\infty, t) = 0, \quad (3)$$

for a semi-infinite aquifer, the case of a finite aquifer will be discussed later.

This problem can be interpreted as describing the interaction between a free body of water of height H in a channel located at $x < 0$ and an unconfined aquifer located at $x > 0$, S being the specific yield and K the hydraulic conductivity.
