Hoffart, 2020-11-13 This book is a philosophical critique of the economics of climate change from both an ethical and philosophy of economics perspective Mitigating climate change is not so much a scientific problem but rather a political social and above all an economic problem A future without greenhouse gas emissions requires a radical transformation towards a sustainable low carbon economy and society How this transformation could be achieved raises numerous economic questions Many of these questions remain untouched although economists are equipped with a suitable toolkit and expertise This book argues that economists have a social responsibility to carry out more research on how global warming could be stopped and that ultimately economic analysis of climate change must be a political economic approach that treats the economy as part of a wider social system This approach will be of interest to policy makers educators students and researchers in support of more pluralism in economic research and teaching

Climate Economics Frank Ackerman,Elizabeth A. Stanton,2013 Climate science paints a bleak picture The continued growth of greenhouse gas emissions is increasingly likely to cause irreversible and catastrophic effects Urgent action is needed to prepare for the initial rounds of climatic change which are already unstoppable While the opportunity to avert all climate damage has now passed well designed mitigation and adaptation policies if adopted quickly could still greatly reduce the likelihood of the most tragic and far reaching impacts of climate change Climate economics is the bridge between science and policy translating scientific predictions about physical systems into projections about economic growth and human welfare that decision makers can most readily use but it has too often consisted of an overly technical academic approach to the problem Getting climate economics right is not about publishing the cleverest article of the year but rather about helping solve the dilemma of the century The tasks ahead are daunting and failure unfortunately is quite possible Better approaches to climate economics will allow economists to be part of the solution rather than part of the problem This book analyzes potential paths for improvement

Climate Change and Agriculture Robert O. for additional work and solid results for policy debate concerning income distributional effects such as abatement adaptation and equity Agriculture and grazing are a central sector in the livelihood of many people particularly in developing countries This book uses the Ricardian method to examine the impact of climate change on agriculture It also quantifies how farmers adapt to climate The findings suggest that agriculture in developing countries is more sensitive to climate than agriculture in developed countries Rain fed cropland is generally more sensitive to warming than irrigated cropland and cropland is more sensitive than livestock The adaptation to climate change results reveal that farmers make many adjustments including switching crops and livestock species adopting irrigation and moving between livestock and crops The results also reveal that impacts and adaptations vary a great deal across landscapes suggesting that adaptation policies must be location specific Finally the book suggests a research agenda for the future Economists in academia and the public sector policy analysts and development agencies will find this broad study illuminating
