Principles of Heating, Ventilation, and Air Conditioning in Buildings John W. Mitchell, James E. Braun, 2012-03-06

Principles of HVAC in Buildings by J W Mitchell and J E Braun provides foundational knowledge for the behavior and analysis of HVAC systems and related devices. The emphasis is on the application of engineering principles and features a tight integration of physical descriptions with a software program that allows performance to be directly calculated with results that provide insight into actual behavior. The examples, end-of-chapter problems, and design projects are more than exercises; they represent situations that an engineer might face in practice and are selected to illustrate the complex and integrated nature of an HVAC system or piece of equipment. Coverage of material applicable to the field is broad. A Fundamentals section on thermodynamics, fluid flow, heat transfer, and psychrometrics; types of HVAC systems and components; comfort and air quality criteria; a Loads section on weather data processing, design heating and cooling loads; an Equipment section on air and water distribution systems, heating and cooling coils, cooling towers, refrigeration equipment; and a Design and Control section on seasonal energy use control techniques, supervisory control, the HVAC design process, and the rules of thumb often used in design. The textbook provides a foundation for students and practicing engineers to design HVAC systems for buildings. In addition, there is extensive supplemental online material that provides more in-depth and comprehensive treatment of equipment and component modeling and performance that is geared towards current and future equipment design engineers.

*Modeling System*, 1994. The National Energy Modeling System (NEMS) is a computer-based energy economy modeling system of US energy markets for the midterm period of 1990 to 2010. NEMS projects the production, imports, conversion, consumption, and prices of energy, subject to assumptions on macroeconomic and financial factors, world energy markets, resource availability, and costs, behavioral and technological choice criteria, cost and performance characteristics of energy technologies, and demographics. This report presents an overview of the structure and methodology of NEMS and each of its

components The first chapter provides a description of the design and objectives of the system The second chapter describes the modeling structure The remainder of the report summarizes the methodology and scope of the component modules of NEMS The model descriptions are intended for readers familiar with terminology from economics operations research and energy modeling Additional background on the development of the system is provided in Appendix A of this report which describes the EIA modeling systems that preceded NEMS More detailed model documentation reports for all the NEMS modules are also available from EIA
