Conservation Service Curve Number (SCS-CN) Methodology S.K. Mishra,V.P. Singh,2013-03-14 The Soil Conservation Service SCS curve number CN method is one of the most popular methods for computing the runoff volume from a rainstorm It is popular because it is simple easy to understand and apply and stable and accounts for most of the runoff producing watershed characteristics such as soil type land use hydrologic condition and antecedent moisture condition The SCS CN method was originally developed for its use on small agricultural watersheds and has since been extended and applied to rural forest and urban watersheds Since the inception of the method it has been applied to a wide range of environments In recent years the method has received much attention in the hydrologic literature The SCS CN method was first published in 1956 in Section 4 of the National Engineering Handbook of Soil Conservation Service now called the Natural Resources Conservation Service U S Department of Agriculture The publication has since been revised several times However the contents of the methodology have been nonetheless more or less the same Being an agency methodology the method has not passed through the process of a peer review and is in general accepted in the form it exists Despite several limitations of the method and even questionable credibility at times it has been in continuous use for the simple reason that it works fairly well at the field level

Open-Channel Flow M. Hanif Chaudhry,2007-11-16 Analysis of open channel flow is essential for the planning design and operation of water resource projects The use of computers and the availability of efficient computational procedures has simplified such analysis and made it possible to handle increasingly complex systems In *Open Channel Flow Second Edition* author Hanif Chaudhry draws upon years of practical experience and incorporates numerous examples and real life applications to provide the reader with A strong emphasis on the application of efficient solution techniques computational procedures and numerical methods suitable for computer analyses Complete coverage of steady and unsteady flow techniques A new chapter on sediment transport and updated chapters on uniform flow and two dimensional flow techniques New and updated problem sets and exercises a solutions manual for instructors *Open Channel Flow Second Edition* is written for students in senior level undergraduate and graduate courses on steady and unsteady open channel flow and for civil engineers needing up to date and relevant information on the latest developments and techniques in the field

Rainfall-Runoff Modelling Keith J. Beven,2012-01-30 *Rainfall Runoff Modelling The Primer Second Edition* is the follow up of this popular and authoritative text first published in 2001 The book provides both a primer for the novice and detailed descriptions of techniques for more advanced practitioners covering rainfall runoff models and their practical applications This new edition extends these aims to include additional chapters dealing with prediction in ungauged basins predicting residence time distributions predicting the impacts of change and the next generation of hydrological models Giving a comprehensive summary of available techniques based on established practices and recent research the book offers a

thorough and accessible overview of the area Rainfall Runoff Modelling The Primer Second Edition focuses on predicting hydrographs using models based on data and on representations of hydrological process Dealing with the history of the development of rainfall runoff models uncertainty in mode predictions good and bad practice and ending with a look at how to predict future catchment hydrological responses this book provides an essential underpinning of rainfall runoff modelling topics Fully revised and updated version of this highly popular text Suitable for both novices in the area and for more advanced users and developers Written by a leading expert in the field Guide to internet sources for rainfall runoff modelling software

Planning and Evaluation of Irrigation Projects Raveendra Kumar Rai, Vijay P. Singh, Alka Upadhyay, 2017-04-06 Planning and Evaluation of Irrigation Projects Methods and Implementation presents the considerations options and factors necessary for effective implementation of irrigation strategies going further to provide methods for evaluating the efficiency of systems in place for remedial correction as needed As the first book to take this lifecycle approach to agricultural irrigation it includes real world examples not only on natural resource availability concerns but also on financial impacts and measurements With 21 chapters divided into two sections this book is a valuable resource for agricultural and hydrology engineers conservation scientists and anyone seeking to implement and maintain irrigation systems Uses real world examples to present practical insights Incorporates both planning and evaluation for full scope understanding and application Illustrates both potential benefits and limitations of irrigation solutions Provides potential means to increase crop productivity that can result in improved farm income

Flood Routing in Ungauged Catchments Using Muskingum Methods Mesfin H. Tewolde, 2008-03-27 River stage or flow rates are required for the design and evaluation of hydraulic structures Most river reaches are ungauged and a methodology is needed to estimate the stages or rates of flow at specific locations in streams where no measurements are available Flood routing techniques are utilised to estimate the stages or rates of flow in order to predict flood wave propagation along river reaches Models can be developed for gauged catchments and their parameters related to physical characteristics such as slope reach width reach length so that the approach can be applied to ungauged catchments in the region The objective of this study is to assess Muskingum based methods for flow routing in ungauged river reaches both with and without lateral inflows Using observed data the model parameters were calibrated to assess performance of the Muskingum flood routing procedures and the Muskingum Cunge method was then assessed using catchment derived parameters for use in ungauged river reaches The Muskingum parameters were derived from empirically estimated variables and variables estimated from assumed river cross sections within the selected river reaches used Three sub catchments in the Thukela catchment in KwaZulu Natal South Africa were selected for analyses with river lengths of 4 21 and 54 km The slopes of the river reaches and reach lengths were derived from a digital elevation model Manning roughness coefficients were estimated from field observations Flow variables such as velocity hydraulic radius wetted perimeters flow depth and top flow width were determined from empirical equations and

cross sections of the selected rivers Lateral inflows to long river reaches were estimated from the Saint Venant equation Observed events were extracted for each sub catchment to assess the Muskingum Cunge parameter estimation method and Three parameter Muskingum method The extracted events were further analysed using empirically estimated flow variables The performances of the methods were evaluated by comparing both graphically and statistically the simulated and observed hydrographs Sensitivity analyses were undertaken using three selected events and a 50% variation in selected input variables was used to identify sensitive variables The performance of the calibrated Muskingum Cunge flood routing method using observed hydrographs displayed acceptable results Therefore the Muskingum Cunge flood routing method was applied in ungauged catchments with variables estimated empirically The results obtained shows that the computed outflow hydrographs generated using the Muskingum Cunge method with the empirically estimated variables and variables estimated from cross sections of the selected rivers resulted in reasonably accurate computed outflow hydrographs with respect to peak discharge timing of peak flow and volume From this study it is concluded that the Muskingum Cunge method can be applied to route floods in ungauged catchments in the Thukela catchment and it is postulated that the method can be used to route floods in other ungauged rivers in South Africa
