**Intelligent Systems and Financial Forecasting** Jason Kingdon,2012-12-06 A fundamental objective of Artificial Intelligence AI is the creation of intelligent computer programs In more modest terms AI is simply concerned with expanding the repertoire of computer applications into new domains and to new levels of efficiency The motivation for this effort comes from many sources At a practical level there is always a demand for achieving things in more efficient ways Equally there is the technical challenge of building programs that allow a machine to do something a machine has never done before Both of these desires are contained within AI and both provide the inspirational force behind its development In terms of satisfying both of these desires there can be no better example than machine learning Machines that can learn have an in built efficiency The same software can be applied in many applications and in many circumstances The machine can adapt its behaviour so as to meet the demands of new or changing environments without the need for costly re programming In addition a machine that can learn can be applied in new domains with the genuine potential for innovation In this sense a machine that can learn can be applied in areas where little is known about possible causal relationships and even in circumstances where causal relationships are judged not to exist This last aspect is of major significance when considering machine learning as applied to financial forecasting *An Algorithmic Crystal Ball: Forecasts-based on Machine Learning* Jin-Kyu Jung,Manasa Patnam,Anna Ter-Martirosyan,2018-11-01 Forecasting macroeconomic variables is key to developing a view on a country s economic outlook Most traditional forecasting models rely on fitting data to a pre specified relationship between input and output variables thereby assuming a specific functional and stochastic process underlying that process We pursue a new approach to forecasting by employing a number of machine learning algorithms a method that is data driven and imposing limited restrictions on the nature of the true relationship between input and output variables We apply the Elastic Net SuperLearner and Recurring Neural Network algorithms on macro data of seven broadly representative advanced

and emerging economies and find that these algorithms can outperform traditional statistical models thereby offering a relevant addition to the field of economic forecasting

**Forecasting Financial Markets Using Neural Networks** Jason E. Kutsurelis, 1998 This research examines and analyzes the use of neural networks as a forecasting tool Specifically, a neural network's ability to predict future trends of Stock Market Indices is tested Accuracy is compared against a traditional forecasting method, multiple linear regression analysis Finally, the probability of the model's forecast being correct is calculated using conditional probabilities While only briefly discussing neural network theory, this research determines the feasibility and practicality of using neural networks as a forecasting tool for the individual investor This study builds upon the work done by Edward Gately in his book *Neural Networks for Financial Forecasting* This research validates the work of Gately and describes the development of a neural network that achieved a 93.3 percent probability of predicting a market rise and an 88.07 percent probability of predicting a market drop in the S P500 It was concluded that neural networks do have the capability to forecast financial markets and if properly trained, the individual investor could benefit from the use of this forecasting tool

respectively for cotton For oil the forecast averaging does not provide improvements in terms of RMSE We suggest using a forecast averaging method and extending our analysis to a wide range of commodity prices

Predictive Analytics With Matlab Regression and Neural Networks J. Smith, 2017-04-18 Predictive analytics is an area of statistics that deals with extracting information from data and using it to predict trends and behavior patterns Often the unknown event of interest is in the future but predictive analytics can be applied to any type of unknown whether it be in the past present or future For example identifying suspects after a crime has been committed or credit card fraud as it occurs The core of predictive analytics relies on capturing relationships between explanatory variables and the predicted variables from past occurrences and exploiting them to predict the unknown outcome It is important to note however that the accuracy and usability of results will depend greatly on the level of data analysis and the quality of assumptions This books develops the more important predictive models like Regression Models Generalized Regression Models Discrete Choice Models Logit and Probit Models Support Vector Machine Regression Gaussian Process Regression Regression Trees Regression Models with Neural Networks and Neural Networks Time Series Prediction
