Performance Tuning for IBM Security Directory Server Annemarie Fitterer, Dave Bachmann, David Butler, Ben Matteson, Ramamohan T. Reddy, Sujay Shinde, Rick Smith, IBM Redbooks, 2014-04-02 In today's highly connected world directory servers are the IT cornerstone of many businesses. These components of the corporate infrastructure are the foundation of authentication systems for internal and more commonly external user populations. Managing a directory server with several hundred internal users is not all that difficult. However, managing a directory server with several million external users in all 24 time zones throughout the world is a much more daunting task. IBM Security Directory Server software can handle millions of entries given the right architecture configuration and performance tuning. However, that tuning can differ greatly from tuning for a smaller server with only a few hundred thousand entries. Managing and tuning a directory server of this size requires a change in mindset. Tuning and performance must be a focus even before the hardware is ordered. A proactive approach must be taken after installation, also including the pretuning steps to better interface with other products to make installations and migrations successful and then regular maintenance to keep the directory running smoothly. This IBM Redbooks publication is the accumulation of lessons learned in many different real-world environments, including a 24 server fault-tolerant configuration with more than 300 million entries. The authors pooled their knowledge and resources to provide the most comprehensive performance view possible, from hardware to software, sort heaps to buffer pools and table cardinalities. In large directory server deployments, use this document as a guide for how to get the right fit for your environment.

LDAP Directories Explained Brian Arkills, 2003 Directory services matter to nearly every organization because they help centrally manage information and thereby reduce the costs of computing services. LDAP (Lightweight Directory Access Protocol) is a set of protocols that have become the internet standard for accessing directories. Many people need to understand directory services and LDAP in order to make decisions for their business. The books currently available are too advanced for technical managers and those new to directory services. This book is designed to fill that need. The author spends the first half of the book exploring how directory services and LDAP work and then the second half discussing the most popular implementations: OpenLDAP, Microsoft Active Directory, and Directory Server. For those who are trying to compare products, this book provides the technical foundation that will enable IT managers to make sound business decisions and developers to move on to more advanced books.
