Materials in a nuclear environment are exposed to extreme conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material behavior very different from conventional materials This is evident for the four major technological challenges the nuclear technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their behavior in order to assess their performance and to determine the limits of operation **Comprehensive Nuclear Materials Second Edition Seven Volume Set** provides broad ranging validated summaries of all the major topics in the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The articles are written at a level that allows undergraduate students to understand the material while providing active researchers with a ready reference resource of information Most of the chapters from the first Edition have been revised and updated and a significant number of new topics are covered in completely new material During the ten years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world events public awareness and technological innovation Materials play a key role as enablers of new technologies and we trust that this new edition of **Comprehensive Nuclear Materials** has captured the key recent developments Critically reviews the major classes and functions of materials supporting the selection assessment validation and engineering of materials in extreme nuclear environments **Comprehensive** resource for up to date and authoritative information which is not always available elsewhere even in journals Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues Serves as an excellent entry point for students and researchers new to the field **Elemental Carbon** Peter J F Harris, 2024-12-20

The science of carbon materials has experienced a renaissance in recent decades with Nobel prizes having been awarded for the discovery of C₆₀ in 1996 and graphene in 2010 Other areas of carbon science have also flourished with notable advances having been made in the synthesis of diamond by chemical vapour deposition and in the preparation and applications of carbon dots **Elemental Carbon** provides an overview of the most rapidly developing areas of contemporary carbon science including both well established materials such as graphite and carbon black and new forms such as graphene As well as giving a brief history of each topic the five chapters provide reviews of the latest research covering synthesis chemical and

industrial applications that require temperatures higher than the outlet temperatures of present nuclear reactors The Baseline Graphite Characterization Program is establishing accurate as manufactured mechanical and physical property distributions in nuclear grade graphites by providing comprehensive data that captures the level of variation in measured values In addition to providing a thorough comparison between these values in different graphite grades the program is also carefully tracking individual specimen source position and orientation information in order to provide comparisons both in specific properties and in the associated variability between different lots different billets and different positions from within a single billet This report is a preliminary comparison between each of the grades of graphite that are considered candidate grades from four major international graphite producers These particular grades NBG 18 NBG 17 PCEA IG 110 and 2114 are the major focus of the evaluations presently underway on irradiated graphite properties through the series of Advanced Graphite Creep AGC experiments NBG 18 a medium grain pitch coke graphite from SGL from which billets are formed via vibration molding was the favored structural material in the pebble bed configuration NBG 17 graphite from SGL is essentially NBG 18 with the grain size reduced by a factor of two PCEA petroleum coke graphite from GrafTech with a similar grain size to NBG 17 is formed via an extrusion process and was initially considered the favored grade for the prismatic layout IG 110 and 2114 from Toyo Tanso and Mersen formerly Carbone Lorraine respectively are fine grain grades produced via an isomolding process An analysis of the comparison between each of these grades will include not only the differences in fundamental and statistically significant individual strength levels but also the differences in the overall variability in properties within each of the grades that will ultimately provide the basis for predicting in service performance The comparative performance of the different types of nuclear grade graphites will naturally continue to evolve as thousands more specimens are fully characterized with regard to strength physical properties and thermal performance from the numerous grades of graphite being evaluated *AGC-3 Graphite Preirradiation Data Analysis Report*, 2013 This report describes the specimen loading order and documents all pre irradiation examination material property measurement data for the graphite specimens contained within the third Advanced Graphite Capsule AGC 3 irradiation capsule The AGC 3 capsule is third in six planned irradiation capsules comprising the Advanced Graphite Creep AGC test series The AGC test series is used to irradiate graphite specimens allowing quantitative data necessary for predicting the irradiation behavior and operating performance of new nuclear graphite grades to be generated which will ascertain the in service behavior of the graphite for pebble bed and prismatic Very High Temperature Reactor VHTR designs The general design of AGC 3 test capsule is similar to the AGC 2 test capsule material property tests were conducted on graphite specimens prior to loading into the AGC 3 irradiation assembly However the 6 major nuclear graphite grades in AGC 2 were modified two previous graphite grades IG 430 and H 451 were eliminated and one was added Mersen s 2114 was added Specimen testing from three graphite grades PCEA 2114 and NBG 17 was conducted at Idaho National Laboratory INL and specimen testing for two

grades IG 110 and NBG 18 were conducted at Oak Ridge National Laboratory ORNL from May 2011 to July 2013 This report also details the specimen loading methodology for the graphite specimens inside the AGC 3 irradiation capsule The AGC 3 capsule design requires matched pair creep specimens that have similar dose levels above and below the neutron flux profile mid plane to provide similar specimens with and without an applied load This document utilized the neutron flux profile calculated for the AGC 3 capsule design the capsule dimensions and the size length of the selected graphite and silicon carbide samples to create a stacking order that can produce matched pairs of graphite samples above and below the AGC 3 capsule elevation mid point to provide specimens with similar neutron dose levels

Research and Development on Advanced Graphite Materials. Volume XXvi. Physical Properties of Some Newly Developed Graphite Grades R. B. DULL,NATIONAL CARBON CO LAWRENCEBURG TENN.,1964 Physical properties are measured on graphites recently developed and or evaluated Methods of and equipment for making these measurements are described The physical properties are reported for 17 newly developed graphite grades which include six high density recrystallized graphites designated as ZT grades six graphites in which the fillers are shredded or woven carbonized cloths designated as PT grades and five pressure cured and or impregnated grades designated as RVA RVC RVD CFZ and CFW Similar properties of ATJ graphite are presented as a basis for comparing the newly developed grades with a well established premium grade of graphite Author The Industrial Graphite Engineering Handbook D. Baseline Graphite Characterization ,2010 The Next Generation Nuclear Plant Project Graphite Research and Development program is currently establishing the safe operating envelope of graphite core components for a very high temperature reactor design To meet this goal the program is generating the extensive amount of quantitative data necessary for predicting the behavior and operating performance of the available nuclear graphite grades In order determine the in service behavior of the graphite for the latest proposed designs two main programs are underway The first the Advanced Graphite Creep AGC program is a set of experiments that are designed to evaluate the irradiated properties and behavior of nuclear grade graphite over a large spectrum of temperatures neutron fluences and compressive loads Despite the aggressive experimental matrix that comprises the set of AGC test runs a limited amount of data can be generated based upon the availability of space within the Advanced Test Reactor and the geometric constraints placed on the AGC specimens that will be inserted In order to supplement the AGC data set the Baseline Graphite Characterization program will endeavor to provide supplemental data that will characterize the inherent property variability in nuclear grade graphite without the testing constraints of the AGC program This variability in properties is a natural artifact of graphite due to the geologic raw materials that are utilized in its production This variability will be quantified not only within a single billet of as produced graphite but also from billets within

a single lot billets from different lots of the same grade and across different billets of the numerous grades of nuclear graphite that are presently available. The thorough understanding of this variability will provide added detail to the irradiated property data and provide a more thorough understanding of the behavior of graphite that will be used in reactor design and licensing. This report covers the development of the Baseline Graphite Characterization program from a testing and data collection standpoint through the completion of characterization on the first billet of nuclear grade graphite. This data set is the starting point for all future evaluations and comparisons of material properties.
