Modern Climate Change Science G. Thomas Farmer, 2014-08-11 Composed of two extensive sections this book surveys important work in climate change science mainly in the United States and introduces contributions to the body of science that have arrived on the scene between January 2013 and February 2014 The opening section offers a broad examination of contemporary climate change science with subsections on the Intergovernmental Panel on Climate Change IPCC Earth's energy imbalance and energy flow carbon dioxide's role in the greenhouse effect climate forcing and climate feedbacks Charles David Keeling and the Keeling Curve the interfaces of atmosphere with oceans and land paleoclimates and paleoclimatology rising sea level melting glaciers deforestation desertification more violent storms animal and human migration extinction of species and more The second section reviews and assesses the newest contributions to the body of research Among the topics discussed are current and recent research on rising temperatures the BEST study the Global Historical Climatology Network GHCN and the National Climatic Data Center NCDC current and recent research on climate models new research on global warming 56 million years ago ecosystem impacts projections of future climate and more This book can be considered a bridge between the volumes of Farmer and Cook's Climate Change Science A Modern Synthesis as it arrives between the release of the first volume on the Physical Climate 2013 the second on Earth's climate history which is now in preparation The book benefits a wide audience as its survey of the science of climate change provides an introduction to the subject and a discussion of current research in the field The book may be used as a refresher for those who have had prior courses in climate science and related fields Each chapter includes a comprehensive list of references for subjects discussed in the text

Climate of the Past, Present and Future Javier Vinós, 2022-09-20 This book is an unorthodox ground breaking scientific study on natural climate change and its contribution to ongoing multi centennial global warming The book critically reviews the effect of the following on climate Milankovitch cycles abrupt glacial Dansgaard Oeschger events Holocene climate variability the 1500 year cycle solar activity volcanic eruptions greenhouse gases energy transport Applying the scientific method to available evidence reveals that some of these phenomena are profoundly misunderstood by most researchers Milankovitch cycles are tied to orbital obliquity not to orbital precessional summer insolation glacial megatides might have triggered abrupt Dansgaard Oeschger events and tides are likely responsible for the related 1500 year climate cycle Climate change affects volcanic eruptions more than the opposite and secular variations in solar activity are more important to climate change during the Holocene than greenhouse gases In this book we see how important natural climate change has been on human societies of the past It also produces new climate projections for the 21st century and when the next glaciation could happen What emerges from this study of natural climate

change is a central theme Variations in the transport of energy from the tropics to the poles have been neglected as a cause of climate change and solar activity variations affect climate by modulating this transport The author tells us Transporting more energy from a greenhouse gas rich region the tropics to a greenhouse gas poor region the poles increases the amount of energy lost at the top of the atmosphere The effect resembles a reduction in the greenhouse gas content The book presents the Winter Gatekeeper Hypothesis on how variations in solar activity regulate Earth's energy transport and in so doing affect atmospheric circulation the rotation of the planet and the El Niño Southern Oscillation This book is oriented toward students and academics in the climate sciences and climate anthropology and should also appeal to readers interested in the science of natural climate change The repercussions of Climate of the Past Present and Future are far reaching By uncovering a strong natural climate change component it provides a novel view of anthropogenic climate change fossil energy use and our future climate a view quite different from the IPCC's gloomy projections

The Science and Politics of Global Climate Change Andrew E. Dessler, Edward A. Parson, 2006 In this accessible primer Dessler and Parson combine their expertise in atmospheric science and public policy to help scientists policy makers and the public sort through the conflicting claims in the climate change debate The authors explain how scientific and policy debates work summarize present scientific knowledge and uncertainty about climate change and discuss the available policy options Along the way they explain WHY the debate is so confusing Anyone with an interest in how science is used in policy debates will find this discussion illuminating The book requires no specialized knowledge but is accessible to any college educated general reader who wants to make more sense of the climate change debate It can also be used as a textbook to explain the details of the climate change debate or as a resource for science students or working scientists to explain how science is used in policy debates

Physical and Mathematical Modeling of Earth and Environment Processes Vladimir Karev, 2025-05-08 The book presents short papers of participants of the 10th International Scientific Conference and School for Young Scientists Physical and Mathematical Modeling of Earth and Environment Processes The book includes theoretical and experimental studies of processes in the atmosphere oceans the lithosphere and their interaction environmental issues problems of human impact on the environment methods of geophysical research Research of the dynamic of natural systems geosphere hydrosphere atmosphere and their interactions the human contribution to naturally occurring processes are among the most urgent and practically important scientific problems Intensive development of research in these areas is due to several factors The widespread introduction of computer technology has allowed beginning calculation of complex phenomena previously unavailable for analysis Creation and improvement of a new generation of geophysical instruments remote observing systems based on the ship aircraft and satellite allowed us to obtain a large amount of data to objectively reflect the picture of the processes The articles included in these book reflect also an important role of the laboratory modeling in searching of processes in geo environments and testing of new developed physical and mathematical models Development of

measurement optic information and other techniques provide new opportunities to perform controllable and reproducible laboratory data for generations of new ideas and concepts Systematic stream of high resolution laboratory data stimulates development of analytical and numerical models of the dynamical processes in three nature environments A special focus is given to the extraction of hydrocarbon resources including from unconventional sources An alternative to the use of hydrocarbons as a main source of energy on the Planet in the coming decades is unlikely to be found At the same time the resource base of hydrocarbons is quickly depleted in particularly large and accessible oil and gas fields The shale oil and gas Arctic hydrocarbon stocks gas hydrates coal bed methane oil and gas from deep horizons can become new sources
