Mathematical Modeling and Scale-Up of Liquid Chromatography Tingyue Gu, 2015-04-06

Tingyue Gu's second edition provides a comprehensive set of nonlinear multicomponent liquid chromatography (LC) models for various forms of LC such as adsorption, size exclusion, ion exchange, reversed phase, affinity, isocratic, gradient elution, and axial radial flow LC. Much has advanced since the first edition of this book, and the author's software described here is now used for teaching and research in 32 different countries. This book comes together with a complete software package with graphical user interface for personal computers, offered free for academic applications. Additionally, this book provides detailed methods for parameter estimation of mass transfer coefficients, bed voidage, particle porosity, and isotherms. The author gives examples of how to use the software for predictions and scale-up. In contrast to the first edition, authors do not need to deal with complicated math. Instead, they focus on how to obtain a few parameters for simulation and how to compare simulation results with experimental data. After reading the detailed descriptions in the book, a reader is able to use the simulation software to investigate chromatographic behavior without doing actual experiments. This book is aimed at readers who are interested in learning about LC behaviors and at those who want to scale up LC for preparative and large scale applications. Both academic personnel and industrial practitioners can benefit from the use of the book. This new edition includes:

- New models and software for pellicular cored beads in liquid chromatography.
- Introduction of user-friendly software with graphical user interface.
- Detailed descriptions on how to use the software.
- Step-by-step instructions on parameter estimation for the models.
- New mass transfer correlations for parameter estimation.
- Experimental methods for parameter estimation.
- Several actual examples using the model for product
