

Temperature

°C, K

measure of average KE  
of motion of particles

Heat

kJ, kcal (Cal) [1 kcal = 4.184 kJ]

measure of total energy transferred from  
an object of high E → low E.

Note: A change in T is accompanied by a transfer of heat energy.

Specific heat (c or  $c_p$ ):

(specific for each substance)

amount of energy required to raise the temperature of 1 g of that substance by 1°C.

change in heat = specific heat x mass x change in T

$$q = c_p \times m \times \Delta T$$

Units: heat absorbed or released, in J;

$\Delta T$  in °C or K; m in g; c in J/g°C

Molar heat capacity = heat capacity in J/mol°C instead of J/g°C

Don't forget: the size of 1°C = 1 K, so K can be used in this calculation in place of °C.

Examples

- How much heat energy is released to your body when a cup of hot tea containing 200. g of water is cooled from 65.0°C to body temperature, 37.0°C? ( $c_p$  of H<sub>2</sub>O = 4.18 J/g°C)
- A 4.50-g nugget of pure gold absorbed 276 J of heat. What was the final temperature of the gold if the initial temperature was 25.0°C? ( $c_p$  of gold = 0.129 J/g°C)
- A 155-g sample of an unknown substance was heated from 25.0°C to 40.0°C. In the process, the substance absorbed 5696 J of energy. What is the specific heat of the substance?

**Quantum-Mechanical Prediction of Thermochemical Data** Jerzy Cioslowski, 2006-04-11 For the first time in the history of chemical sciences theoretical predictions have achieved the level of reliability that allows them to val experimental measurements in accuracy on a routine basis Only a decade ago such a statement would be valid only with severe qualifications as high level quantum chemical calculations were feasible only for molecules composed of a few atoms Improvements in both hardware performance and the level of sophistication of electronic structure methods have contributed equally to this impressive progress that has taken place only recently The contemporary chemist interested in predicting thermochemical properties such as the standard enthalpy of formation has at his disposal a wide selection of theoretical approaches differing in the range of applicability computational cost and the expected accuracy Ranging from high level treatments of electron correlation used in conjunction with extrapolative schemes to semiempirical methods these approaches have well known advantages and shortcomings that determine their usefulness in studies of particular types of chemical species The growing number of published computational schemes and their variants testing sets and performance statistics often makes it difficult for a scientist not well versed in the language of quantum theory to identify the method most adequate for his research needs
