examples and applications illustrating the practical use of the concepts The last five sections are devoted to topics such as separability continuity and measurability of random processes which are discussed in some detail The concept of a simple point process on \mathbb{R} is introduced in Chapter 2 Using the coupling inequality and Le Cam's lemma it is shown that if its counting function is stochastically continuous and has independent increments the point process is Poisson When the counting function is Markovian the sequence of arrival times is also a Markov process Some related topics such as independent thinning and marked point processes are also discussed In the final section an application of these results to flood modeling is presented

Introduction To Stochastic Processes Mu-fa Chen, Yong-hua Mao, 2021-05-25 The objective of this book is to introduce the elements of stochastic processes in a rather concise manner where we present the two most important parts Markov chains and stochastic analysis The readers are led directly to the core of the main topics to be treated in the context Further details and additional materials are left to a section containing abundant exercises for further reading and studying In the part on Markov chains the focus is on the ergodicity By using the minimal nonnegative solution method we deal with the recurrence and various types of ergodicity This is done step by step from finite state spaces to denumerable state spaces and from discrete time to continuous time The methods of proofs adopt modern techniques such as coupling and duality methods Some very new results are included such as the estimate of the spectral gap The structure and proofs in the first part are rather different from other existing textbooks on Markov chains In the part on stochastic analysis we cover the martingale theory and Brownian motions the stochastic integral and stochastic differential equations with emphasis on one dimension and the multidimensional stochastic integral and stochastic equation based on semimartingales We introduce three important topics here the Feynman Kac formula random time transform and Girsanov transform As an essential application of the probability theory in classical mathematics we also deal with the famous Brunn Minkowski inequality in convex geometry This book also features modern probability theory that is used in different fields such as MCMC or even deterministic areas convex geometry and number theory It provides a new and direct routine for students going through the classical Markov chains to the modern stochastic analysis
