Introduction To The Numerical Solution Of Markov Chains:

Introduction to the Numerical Solution of Markov Chains William J. Stewart, 1994-12-04 Markov Chains Direct Methods Iterative Methods Projection Methods Block Hessenberg Matrices Decompositional Methods LI Cyclic Markov Chains Transient Solutions Stochastic Automata Networks Software **Numerical Methods for Structured Markov Chains** Dario A. Bini, Guy Latouche, Beatrice Meini, 2005-02-03 Intersecting two large research areas numerical analysis and applied probability queuing theory this book is a self contained introduction to the numerical solution of structured Markov chains which have a wide applicability in queuing theory and stochastic modeling and include M/G/1 and GI/M/1 type Markov chain quasi birth death processes non skip free queues and tree like stochastic processes Written for applied probabilists and numerical analysts but accessible to engineers and scientists working on telecommunications and evaluation of computer systems performances it provides a systematic treatment of the theory and algorithms for important families of structured Markov chains and a thorough overview of the current literature The book consisting of nine Chapters is presented in three parts Part 1 covers a basic description of the fundamental concepts related to Markov chains a systematic treatment of the structure matrix tools including finite Toeplitz matrices displacement operators FFT and the infinite block Toeplitz matrices their relationship with matrix power series and the fundamental problems of solving matrix equations and computing canonical factorizations Part 2 deals with the description and analysis of structure Markov chains and includes M/G/1 quasi birth death processes non skip free queues and tree like processes Part 3 covers solution algorithms where new convergence and applicability results are proved Each chapter ends with bibliographic notes for further reading and the book ends with an appendix collecting the main general concepts and results used in the book a list of the main annotations and algorithms used in the book and an extensive index **Numerical Solution of Markov Chains** William J. Stewart, 1991-05-23 Papers presented at a workshop held January 1990 location unspecified cover just about all aspects of solving Markov models numerically There are papers on matrix generation techniques and generalized stochastic Petri nets the computation of stationary distributions including aggregation disagg *A First Course in Stochastic Models* Henk C. Tijms, 2003-04-18 The field of applied probability has changed profoundly in the past twenty years The development of computational methods has greatly contributed to a better understanding of the theory *A First Course in Stochastic Models* provides a self contained introduction to the theory and applications of stochastic models Emphasis is placed on establishing the theoretical foundations of the subject thereby providing a framework in which the applications can be understood Without this solid basis in theory no applications can be solved Provides an introduction to the use of stochastic models through an integrated presentation of theory algorithms and applications Incorporates recent developments in computational probability Includes a wide range of examples that illustrate the models and make the methods of solution clear Features an abundance of motivating exercises that help the student learn how to apply the theory Accessible to anyone with a basic knowledge of

probability A First Course in Stochastic Models is suitable for senior undergraduate and graduate students from computer science engineering statistics operations research and any other discipline where stochastic modelling takes place It stands out amongst other textbooks on the subject because of its integrated presentation of theory algorithms and applications

Computations with Markov Chains William J. Stewart, 2012-12-06 Computations with Markov Chains presents the edited and reviewed proceedings of the Second International Workshop on the Numerical Solution of Markov Chains held January 16-18 1995 in Raleigh North Carolina New developments of particular interest include recent work on stability and conditioning Krylov subspace based methods for transient solutions quadratic convergent procedures for matrix geometric problems further analysis of the GTH algorithm the arrival of stochastic automata networks at the forefront of modelling stratagems and more An authoritative overview of the field for applied probabilists numerical analysts and systems modelers including computer scientists and engineers

Quantitative Evaluation of Systems Alessandro Abate, Andrea Marin, 2021-08-19 This book constitutes the proceedings of the 18th International Conference on Quantitative Evaluation Systems QEST 2021 held in Paris France in August 2021 The 21 full papers and 2 short papers presented together with 2 keynote papers were carefully reviewed and selected from 47 submissions The papers are organized in the following topics probabilistic model checking quantitative models and metamodels analysis and validation queueing systems learning and verification simulation performance evaluation abstractions and aggregations and stochastic models

Probability, Markov Chains, Queues, and Simulation William J. Stewart, 2009-07-26 Probability Markov Chains Queues and Simulation provides a modern and authoritative treatment of the mathematical processes that underlie performance modeling The detailed explanations of mathematical derivations and numerous illustrative examples make this textbook readily accessible to graduate and advanced undergraduate students taking courses in which stochastic processes play a fundamental role The textbook is relevant to a wide variety of fields including computer science engineering operations research statistics and mathematics The textbook looks at the fundamentals of probability theory from the basic concepts of set based probability through probability distributions to bounds limit theorems and the laws of large numbers Discrete and continuous time Markov chains are analyzed from a theoretical and computational point of view Topics include the Chapman Kolmogorov equations irreducibility the potential fundamental and reachability matrices random walk problems reversibility renewal processes and the numerical computation of stationary and transient distributions The M/M/1 queue and its extensions to more general birth death processes are analyzed in detail as are queues with phase type arrival and service processes The M/G/1 and G/M/1 queues are solved using embedded Markov chains the busy period residual service time and priority scheduling are treated Open and closed queueing networks are analyzed The final part of the book addresses the mathematical basis of simulation Each chapter of the textbook concludes with an extensive set of exercises An instructor's solution manual in which all exercises are completely worked out is also available to professors only Numerous examples
