Control Systems and Reinforcement Learning Sean

Meyn, 2022-06-09 A high school student can create deep Q learning code to control her robot without any understanding of the meaning of deep or Q or why the code sometimes fails This book is designed to explain the science behind reinforcement learning and optimal control in a way that is accessible to students with a background in calculus and matrix algebra A unique focus is algorithm design to obtain the fastest possible speed of convergence for learning algorithms along with insight into why reinforcement learning sometimes fails Advanced stochastic process theory is avoided at the start by substituting random exploration with more intuitive deterministic probing for learning Once these ideas are understood it is not difficult to master techniques rooted in stochastic control These topics are covered in the second part of the book starting with Markov chain theory and ending with a fresh look at actor critic methods for reinforcement learning

Algorithms for Reinforcement Learning Csaba Szepesvari, 2010-08-08 Reinforcement learning is a learning paradigm concerned with learning to control a system so as to maximize a numerical performance measure that expresses a long term objective What distinguishes reinforcement learning from supervised learning is that only partial feedback is given to the learner about the learner's predictions Further the predictions may have long term effects through influencing the future state of the

controlled system Thus time plays a special role The goal in reinforcement learning is to develop efficient learning algorithms as well as to understand the algorithms merits and limitations Reinforcement learning is of great interest because of the large number of practical applications that it can be used to address ranging from problems in artificial intelligence to operations research or control engineering In this book we focus on those algorithms of reinforcement learning that build on the powerful theory of dynamic programming We give a fairly comprehensive catalog of learning problems describe the core ideas note a large number of state of the art algorithms followed by the discussion of their theoretical properties and limitations Table of Contents Markov Decision Processes Value Prediction Problems Control For Further Exploration

Reinforcement Learning and Approximate Dynamic Programming for Feedback Control Frank L. Lewis, Derong Liu, 2013-01-28 Reinforcement learning RL and adaptive dynamic programming ADP has been one of the most critical research fields in science and engineering for modern complex systems This book describes the latest RL and ADP techniques for decision and control in human engineered systems covering both single player decision and control and multi player games Edited by the pioneers of RL and ADP research the book brings together ideas and methods from many fields and provides an important and timely guidance on controlling a wide variety of systems such as robots industrial processes and economic decision making

Abstract Dynamic Programming Dimitri Bertsekas, 2018-02-01 A research monograph providing a synthesis of old research on the foundations of dynamic programming with the modern theory of approximate dynamic programming and new research on semicontractive models It aims at a unified and economical development of the core theory and algorithms of total cost sequential decision problems based on the strong connections of the subject with fixed point theory The analysis focuses on the abstract mapping that underlies dynamic programming and defines the mathematical character of the associated problem The discussion centers on two fundamental properties that this mapping may have monotonicity and weighted sup norm contraction It turns out that the nature of the analytical and algorithmic DP theory is determined primarily by the presence or absence of these two properties and the rest of the problem s structure is largely inconsequential New research is focused on two areas 1 The ramifications of these properties in the context of algorithms for approximate dynamic programming and 2 The new class of semicontractive models exemplified by stochastic shortest path problems where some but not all policies are contractive The 2nd edition aims primarily to amplify the presentation of the semicontractive models of Chapter 3 and Chapter 4 of the first 2013 edition and to supplement it with a broad spectrum of research results that I obtained and published in journals and reports since the first edition was written see below As a result the size of this material more than doubled and the size of the book increased by nearly 40% The book is an excellent supplement to several of our books *Dynamic Programming and Optimal Control* Athena Scientific 2017 and *Neuro Dynamic Programming* Athena Scientific 1996
