Conjugate Gradient Algorithms And Finite Element Methods 1st Edition:

Conjugate Gradient Algorithms and Finite Element Methods Michal Krizek, Pekka Neittaanmäki, Roland Glowinski, Sergey Korotov, 2012-12-06 The position taken in this collection of pedagogically written essays is that conjugate gradient algorithms and finite element methods complement each other extremely well Via their combinations practitioners have been able to solve complicated direct and inverse multidimensional problems modeled by ordinary or partial differential equations and inequalities not necessarily linear optimal control and optimal design being part of these problems The aim of this book is to present both methods in the context of complicated problems modeled by linear and nonlinear partial differential equations to provide an in depth discussion on their implementation aspects The authors show that conjugate gradient methods and finite element methods apply to the solution of real life problems They address graduate students as well as experts in scientific computing

This book size article is dedicated to the numerical simulation of unsteady incompressible viscous flow modelled by the Navier Stokes equations or by non Newtonian variants of them In order to achieve this goal a methodology has been developed based on four key tools Time discretization by operator splitting schemes such as Peaceman Rachford s Douglas Rachford s Marchuk Yanenko s Strang s symmetrized and the so called theta scheme introduced by the author in the mid 1980s Projection methods in L2 or H1 for the treatment of the incompressibility condition $\text{div } u = 0$ Treatment of the advection by either a centered scheme leading to linear or nonlinear advection diffusion problems solved by least squares conjugate gradient algorithms or to a linear wave like equation well suited to finite element based solution methods Space approximation by finite element methods such as Hood Taylor and Bercovier Pironneau which are relatively easy to implement conjugate gradient algorithms least squares methods for boundary value problems which are not equivalent to problems of the calculus of variations Uzawa type algorithms for the solution of saddle point problems embedding fictitious domain methods for the solution of elliptic and parabolic problems In fact many computational methods discussed in this article also apply to non CFD problems although they were mostly designed for the solution of flow problems Among the topics covered are the direct numerical simulation of particulate flow computational methods for flow control splitting methods for visco plastic flow a la Bingham and more It should also be mentioned that most methods discussed in this article are illustrated by the results of numerical experiments including the simulation of three dimensional flow easy to implement as is demonstrated by the fact that several practitioners in various institutions have been able to use them ab initio for the solution of complicated flow and other problems
