(a) Business Cycle

The business cycle is a series of fluctuations in aggregate output, employment, and other macroeconomic variables. The cycle is divided into four phases: expansion, peak, contraction, and trough.

During the expansion phase, aggregate output and employment rise. The economy moves from the trough to the peak. The peak is the point at which aggregate output and employment are at their highest levels.

During the contraction phase, aggregate output and employment fall. The economy moves from the peak to the trough. The trough is the point at which aggregate output and employment are at their lowest levels.

The real business cycle model is a model of the business cycle that focuses on the role of technology and capital accumulation. It shows how changes in technology and capital accumulation affect the business cycle.
