Java in Distributed Systems Marko Boger, 2001-05-25 Large and complex software systems such as Internet applications depend on distributed applications Although Java has helped reduce the complexity of distributed systems developers still have to contend with diverse hardware platforms remote communication over networks and system failures Java in Distributed Systems provides a comprehensive guide for anyone wishing to deepen their knowledge of Java in distributed applications Beginning with a tutorial guide to distributed programming in the Java environment it shows you how building blocks from threads to Jini can help you to fulfil Sun s vision that the Network is the Computer It then goes on to focus on aspects that are still challenging researchers such as concurrency distribution and persistence Key Features One

of the few books to focus specifically on Java for building distributed applications Coverage includes threads sockets RMI CORBA Voyager Mobile agents JDBC object oriented databases Java spaces and Jini Includes advanced chapters on the cutting edge of Java language development including the author s own proposed Dejay Distributed Java an open source project that offers a unified approach to concurrency distribution and persistence Distributed Programming with Java Qusay H. Mahmoud,2000 For programmers already familiar with Java this book offers new techniques on how to develop distributed applications Although it discusses four paradigms low level Sockets Remote Method Invocation CORBA and Mobile Agents this book does not favor any one of these technologies It also allows the reader to judge the easiest approach for a particular domain of applications Concurrent and Distributed Computing in Java Vijay K. Garg,2005-01-14

Concurrent and Distributed Computing in Java addresses fundamental concepts in concurrent computing with Java examples The book consists of two parts The first part deals with techniques for programming in shared memory based systems The book covers concepts in Java such as threads synchronized methods waits and notify to expose students to basic concepts for multi threaded programming It also includes algorithms for mutual exclusion consensus atomic objects and wait free data structures The second part of the book deals with programming in a message passing system This part covers resource allocation problems logical clocks global property detection leader election message ordering agreement algorithms checkpointing and message logging Primarily a textbook for upper level undergraduates and graduate students this thorough treatment will also be of interest to professional programmers *Concurrent, Real-Time and Distributed Programming in Java* Badr Benmammar,2017-12-27 This book provides an introduction to concurrent real time distributed programming with Java object oriented language support as an algorithm description tool It describes in particular the mechanisms of synchronization cooperative and competitive and sharing of data internal class static variables between threads in Java He then discusses the use of Java for real time applications Consequently a presentation of the RTSJ Real Time Specification for Java specification dedicated to the development of real time applications in Java is also introduced in this book Finally a presentation of programming distributed in Java is presented in this book We are particularly interested in communication using the TCP Sockets and high level communication using Java Remote Method Invocation RMI The book also contains an annex which contains a practical set of application exercises in relation to the theme of the book Knowledge of the Java language is a prerequisite for understanding the book **Concurrent and Distributed Computing in Java** Vijay K. Java Distributed Computing Jim Farley,1998 This book shows how to build software in which two or more computers cooperate to produce results It covers Java s RMI Remote Method Invocation facility in addition to CORBA and strategies for developing a distributed framework It pays attention to often neglected issues such as protocol design security and bandwidth requirements

Introduction to Reliable Distributed Programming Rachid Guerraoui,Luís Rodrigues,2006-05-01 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Guerraoui and Rodrigues present an introductory description of fundamental reliable distributed programming abstractions as well as algorithms to implement these abstractions The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one specific class of abstractions covering reliable delivery shared memory consensus and various forms of agreement This textbook comes with a companion set of running examples implemented in Java These can be used by students to get a better understanding of how reliable distributed programming abstractions can be implemented and used in practice Combined the chapters deliver a full course on reliable distributed programming The book can also be used as a complete reference on the basic elements required to build reliable distributed applications

Architecture and Design of Distributed Embedded Systems Bernd Kleinjohann,2013-04-18 Due to the decreasing production costs of IT systems applications that had to be realised as expensive PCBs formerly can now be realised as a system on chip Furthermore low cost broadband communication media for wide area communication as well as for the realisation of local distributed systems are available Typically the market requires IT systems that realise a set of specific features for the end user in a given environment so called embedded systems Some examples for such embedded systems are control systems in cars airplanes houses or plants information and

communication devices like digital TV mobile phones or autonomous systems like service or edutainment robots For the design of embedded systems the designer has to tackle three major aspects The application itself including the man machine interface The target architecture of the system including all functional and non functional constraints and the design methodology including modelling specification synthesis test and validation The last two points are a major focus of this book This book documents the high quality approaches and results that were presented at the International Workshop on Distributed and Parallel Embedded Systems DIPES 2000 which was sponsored by the International Federation for Information Processing IFIP and organised by IFIP working groups WG10 3 WG10 4 and WG10 5 The workshop took place on October 18 19 2000 in Schlo Eringerfeld near Paderborn Germany Architecture and Design of Distributed Embedded Systems is organised similar to the workshop Chapters 1 and 4 Methodology I and II deal with different modelling and specification paradigms and the corresponding design methodologies Generic system architectures for different classes of embedded systems are presented in Chapter 2 In Chapter 3 several design environments for the support of specific design methodologies are presented Problems concerning test and validation are discussed in Chapter 5 The last two chapters include distribution and communication aspects Chapter 6 and synthesis techniques for embedded systems Chapter 7 This book is essential reading for computer science researchers and application developers
