Numerical and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment Umer Afzal,2017 There are many sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without emission source under laminar and

turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts

A New Hypothesis on the Anisotropic Reynolds Stress Tensor for Turbulent Flows László Könözsy,2020-12-01 This self contained interdisciplinary book encompasses mathematics physics computer programming analytical solutions and numerical modelling industrial computational fluid dynamics CFD academic benchmark problems and engineering applications in conjunction with the research field of anisotropic turbulence It focuses on theoretical approaches computational examples and numerical simulations to demonstrate the strength of a new hypothesis and anisotropic turbulence modelling approach for academic benchmark problems and industrially relevant engineering applications This book contains MATLAB codes and C programming language based User Defined Function UDF codes which can be compiled in the ANSYS FLUENT environment The computer codes help to understand and use efficiently a new concept which can also be implemented in any other software packages The simulation results are compared to classical analytical solutions and experimental data taken from the literature A particular attention is paid to how to obtain accurate results within a reasonable computational time for wide range of benchmark problems The provided examples and programming techniques help graduate and postgraduate students engineers and researchers to further develop their technical skills and knowledge
