Introduction

Design variables provide a method for specifying critical parameters just before a simulation. This allows you to make quick changes to parameter values across single or multiple circuit components without having to edit any schematic components. Design variables can also be used in simple parametric analysis, which can change a design variable across a range of values and display multiple simulation results on a single plot.

Using Design Variables

This part of the tutorial will show you how to parametrize the width of the PCBs and PTHs components of an inductor by using design variables. These variable values are then set using the **Running Through Environment** panel in simulation.

1. Make a copy of the circuit with components you have previously designed, or create a new one.
2. Open the schematic of the circuit.
3. Right click on the PCBs component to edit it, and open the properties by either clicking on it and selecting **Properties**, or you can press "q" as a shortcut.
4. Define the **width** in the width box, and type var . This specifies that a variable called var will be used to set the width of the PCBs. When you do this, observe that values for "Thermal/Electrical Difference Keys" change from a constant value to a formula that involves the variable var . Always check to make sure that formula is updated when you change the width to a variable otherwise, your simulation results will be incorrect. Click **OK** to apply the change.
5. Repeat this procedure to change the width of the PTHs to var .
6. Select **Change \rightarrow Check and Save**. Verify that there are no errors.
7. Launch the **Analysis** **Running Through Environment**.
8. Set up the simulation environment as you normally would for simulating a schematic. This includes specifying a simulation file and transient run length, making the SPICE model reader in the environment options, and selecting the outputs to be plotted on the schematic.
9. In **ANYSYS**, select **Variables \rightarrow Copy Hierarchical**. The design variables var and var should appear in the Design Variables area of the **Running Environment** window.
10. In **ANYSYS**, select **Variables \rightarrow Edit**, highlight var . In the value box, type 2.5 and then apply the value by clicking **Apply**. Change the value of var to 3.5 and click **Apply**. Check the values have been assigned, click **OK**. See Figure 1 and 2 below.
11. In **ANYSYS**, use the connections by selecting **Simulation \rightarrow Variable and Run**. After loading the the simulation to complete, the results window will pop-up. The results should be
