An Introduction To High Frequency Finance:

An Introduction to High-Frequency Finance Ramazan Gençay, Michel Dacorogna, Ulrich A. Muller, Olivier Pictet, Richard Olsen, 2001-05-29 Liquid markets generate hundreds or thousands of ticks the minimum change in price a security can have either up or down every business day Data vendors such as Reuters transmit more than 275 000 prices per day for foreign exchange spot rates alone Thus high frequency data can be a fundamental object of study as traders make decisions by observing high frequency or tick by tick data Yet most studies published in financial literature deal with low frequency regularly spaced data For a variety of reasons high frequency data are becoming a way for understanding market microstructure This book discusses the best mathematical models and tools for dealing with such vast amounts of data This book provides a framework for the analysis modeling and inference of high frequency financial time series With particular emphasis on foreign exchange markets as well as currency interest rate and bond futures markets this unified view of high frequency time series methods investigates the price formation process and concludes by reviewing techniques for constructing systematic trading models for financial assets

Diebold, 2002

Volatility has been one of the most active areas of research in empirical finance and time series econometrics during the past decade This chapter provides a unified continuous time frictionless no arbitrage framework for systematically categorizing the various volatility concepts measurement procedures and modeling procedures We define three different volatility concepts i the notional volatility corresponding to the ex post sample path return variability over a fixed time interval ii the ex ante expected volatility over a fixed time interval and iii the instantaneous volatility corresponding to the strength of the volatility process at a point in time The parametric procedures rely on explicit functional form assumptions regarding the expected and or instantaneous volatility In the discrete time ARCH class of models the expectations are formulated in terms of directly observable variables while the discrete and continuous time stochastic volatility models involve latent state variables The nonparametric procedures are generally free from such functional form assumptions and hence afford estimates of notional volatility that are flexible yet consistent as the sampling frequency of the underlying returns increases The nonparametric procedures include ARCH filters and smoothers designed to measure the volatility over infinitesimally short horizons as well as the recently popularized realized volatility measures for non trivial fixed length time intervals
