Nucleation in Condensed Matter Ken Kelton, Alan Lindsay Greer, 2010-03-19 In *Nucleation in Condensed Matter* key theoretical models for nucleation are developed and experimental data are used to discuss their range of validity. A central aim of this book is to enable the reader when faced with a phenomenon in which nucleation appears to play a role to determine whether nucleation is indeed important and to develop a quantitative and predictive description of the nucleation behavior. The third section of the book examines nucleation processes in practical situations ranging from solid state precipitation to nucleation in biological systems to nucleation in food and drink. *Nucleation in Condensed Matter* is a key reference for an advanced materials course in phase transformations. It is also an essential reference for researchers in the field. Unified treatment of key theories, experimental evaluations and case studies. Complete derivation of key models. Detailed discussion of experimental measurements. Examples of nucleation in diverse systems. **Classical and Statistical**

Landsman, 2021-10-08 This book dedicated to Roger Penrose is a second mathematically oriented course in general relativity. It contains extensive references and occasional excursions in the history and philosophy of gravity including a relatively lengthy historical introduction. The book is intended for all students of general relativity of any age and orientation who have a background including at least first courses in special and general relativity, differential geometry and topology. The material is developed in such a way that through the last two chapters the reader may acquire a taste of the modern mathematical study of black holes initiated by Penrose, Hawking and others as further influenced by the initial value or PDE approach to general relativity. Successful readers might be able to begin reading research papers on black holes especially in mathematical physics and in the philosophy of physics. The chapters are: Historical introduction, General differential geometry, Metric differential geometry, Curvature, Geodesics and causal structure, The singularity theorems of Hawking and Penrose, The Einstein equations, The 3+1 split of space-time, Black holes I: Exact solutions and Black holes II: General theory. These are followed by two appendices containing background on Lie groups, Lie algebras, constant curvature and on Formal PDE theory.
