Catalog** National Institute of Standards and Technology (U.S.),1991 Photodissociation Dynamics Reinhard Schinke,1995-05-11 Photodissociation induced by the absorption of single photons permits the detailed study of molecular dynamics such as the breaking of bonds internal energy transfer and radiationless transitions The availability of powerful lasers operating over a wide frequency range has stimulated rapid development of new experimental techniques which make it possible to analyse photodissociation processes in unprecedented detail This text elucidates the achievements in calculating photodissociation cross sections and fragment state distributions from first principles starting from multi dimensional potential energy surfaces and the Schrödinger equation of nuclear motion Following an extended introduction in which the various types of observables are outlined the book summarises the basic theoretical tools namely the time independent and the time dependent quantum

mechanical approaches as well as the classical picture of photodissociation. The discussions of absorption spectra diffuse vibrational structures, the vibrational and rotational state distributions of the photofragments form the core of the book. More specific topics such as the dissociation of vibrationally excited molecules, emission during dissociation or nonadiabatic effects are also discussed. It will be of interest to graduate students and senior scientists working in molecular physics, spectroscopy, molecular collisions and molecular kinetics.

Modern Optical Spectroscopy William W. Parson, 2007-02-20. The student edition of *Modern Optical Spectroscopy* includes a new set of exercises for each chapter. The exercises and problems generally emphasize basic points and often include simplified absorption or emission spectra or molecular orbitals that can be evaluated easily with the aid of a calculator or spreadsheet. Students who are adept at computer programming will find it instructive to try to write algorithms that also could be applied to larger, more complicated sets of data. Spectra introduced in some of the problems for Chaps 4 and 5 are used again in later chapters to illustrate how quantities calculated from the spectra can be applied to topics such as resonance energy transfer and exciton interactions.

Seattle, November 2008. William W. Parson. Preface. This book began as lecture notes for a course on optical spectroscopy that I taught for graduate students in biochemistry, chemistry and our interdisciplinary programs in molecular biophysics and biomolecular structure and design. I started expanding the notes partly to try to illuminate the stream of new experimental information on photosynthetic antennas and reaction centers but mostly just for fun. I hope that readers will find the results not only useful but also as stimulating as I have.
