ABSTRACT: Quick Response (QR) code is 2d code and widely used in magazine advertisement, product packet, museum, and tour tickets. It has high data capacity compare to 1d code. The invisible QR code is watermarked via popular wavelet transform algorithm in images. The results show that the proposed method is robust and tested against attacks.

KEYWORDS: QR code, watermarking, Wavelets.

I. INTRODUCTION

In this modern era mobile and wireless technology is taking over all fields of life. They are more than a communication device; they act as your PC, music player, your bank, your shopping area and more [1]. In near future the smart glasses like google glass are going to replace the current hand held devices which make to overlay the physical world with a digital layer of tags, ads, maps etc [2].

In current smart phone scenario, one of the important technology used to connect the physical world to internet or digital world using smart phone, is QR codes. They are used mainly for marketing and commerce but their applications are numerous including virtual marketing, virtual maps, QRpedia etc. We are making the QR code as invisible watermark in image using digital watermarking technology. Other alternatives proposed were marking QR code in invisible ink which is only visible with Ultraviolet [3], QR transparent stickers etc.

The main challenge in making invisible QR code is the detector part. Since the detection is expected to be done in smart phone which has slower processors, the detection must be very simple with very little processing required before passing information to QR reader. Here we implement and simulate the QR encoder and decoder in MATLAB to study the effectiveness of algorithm. This paper uses watermarking scheme in wavelet domain where multiple copies of QR code is inserted into low frequency components of host image. Since the data requires no secrecy compared to existing watermarking schemes, public watermarking technique is used [4] [5] [6].

An Invisible Watermarking Based Framework for Authenticating Biometric Images Payal Garg, 2023-12-20 It is now routine practice to make large picture archives hosted on publicly accessible internet servers making the photos accessible over the Internet has also allowed malicious actors to change

forgery photos available on the web or replacing them with supplied images Both of these scenarios are possible now Additionally as a result of the proliferation of sophisticated image editing software in recent years many people now have access to the tools necessary to modify the contents of digital images with relative ease producing results that are eerily similar to those produced by professionals working in the conventional photographic medium To address these issues it has become necessary to create methods that can safeguard digital pictures against attacks that are harmful in nature Invisible watermarking is used for data concealment copyright protection and picture verification Several different approaches for invisible watermarking have been documented This research will concentrate mostly on the methods of undetectable watermarking that may be used for picture authentication The Trustworthy Digital Camera included a watermarking system or not public key encryption technology had been used to modify a digital photograph Schendel also led a conversation on manipulating the least significant bit to encode digital signatures on a photo which you can read more about in the previous sentence LSB During the course of the project many methods were designed to embed binary bits at addresses that were produced at random Each pixel s LSB was modified to match the bit that corresponded to it in the string It is quite unusual for invisible watermarking techniques information inscribed on the LSB of picture pixel values to generate visual artefacts in the image When an image is modified the least significant bit LSB almost always shifts which makes it possible for the verification process to identify the update It is not difficult to Create a system that updates picture content without modifying LSBs This can be done to the point where the entire image can be changed without changing the LSB LSB tampering is vulnerable to malicious attacks When this occurs verification does not pick up modifications which is dependent on the LSB The verification process of some existing techniques for invisible watermarking is limited by the fact that these techniques cannot determine the specific regions of an image that have been altered Instead they can only indicate if an image has been altered This is merely one of these methods drawbacks Using this information more effective safety measures could be created In the image verification process the portions of the image that have been altered can be determined and localized with the help of the suggested watermarking approach and removing watermarks If the verified key is unknown a change to one region s pixel values will certainly cause watermark pixels to differ artefacts in the extracted watermark image This type of Verification doesn t require an original unwatermarked source image and it is efficient because the technique for watermark extraction only requires a small number of operations For a Verifiable invisible watermarking it must be nearly Interloper can t tell if a picture is watermarked whether the information is embedded or not and that the interloper is unable to edit or reapply the watermark In order to evade verification In other words an interloper must not be able to Identify watermarked images Therefore within the framework of this particular technique the embedded watermark may be identified throughout its detection by only LSB analysis which are pixel distributions produced following the watermarking procedure

Research Division,Scott Craver,Nasir Memon,Boon-Lock Yeo,Minerva M. Yeung,1997 Abstract Digital watermarks have been proposed in recent literature as a means for copyright protection of multimedia data In this paper we address the capability of invisible watermarking schemes to resolve copyright ownerships We show that in certain applications rightful ownerships cannot be resolved by current watermarking schemes alone Specifically we attack existing techniques by providing counterfeit watermarking schemes that can be performed on a watermarked image to allow multiple claims of rightful ownerships In the absence of standardization and specific requirements imposed on watermarking procedures anyone can claim ownership of any watermarked image In order to protect against the counterfeiting techniques that we develop we examine the properties necessary for resolving ownership via invisible watermarking We introduce and study invertibility and quasi invertibility of invisible watermarking techniques We propose non invertible watermarking schemes and subsequently give examples of techniques that we believe to be non quasi invertible and hence invulnerable against more sophisticated attacks proposed in the paper The attacks and results presented in the paper and the remedies proposed further imply that we have to carefully re evaluate the current approaches and techniques in invisible watermarking of digital images based on application domains and re think the promises applications and implications of such digital means of copyright protection
