Topics in Mathematical Modeling Ka-Kit Tung, 2016-06-14 **Topics in Mathematical Modeling** is an introductory textbook on mathematical modeling The book teaches how simple mathematics can help formulate and solve real problems of current research interest in a wide range of fields including biology ecology computer science geophysics engineering and the social sciences Yet the prerequisites are minimal calculus and elementary differential equations Among the many topics addressed are HIV plant phyllotaxis global warming the World Wide Web plant and animal vascular networks social networks chaos and fractals marriage and divorce and El Ni o Traditional modeling topics such as predator prey interaction harvesting and wars of attrition are also included Most chapters begin with the history of a problem follow with a demonstration of how it can be modeled using various mathematical tools and close with a discussion of its remaining unsolved aspects Designed for a one semester course the book progresses from problems that can be solved with relatively simple mathematics to ones that require more sophisticated methods The math techniques are taught as needed to solve the problem being addressed and each chapter is designed to be largely independent to give teachers flexibility The book which can be used as an overview and introduction to applied mathematics is particularly suitable for sophomore junior and senior students in math science and engineering

Dynamical Systems with Applications using Maple™ Stephen Lynch, 2009-12-23 Since the first edition of this book was published in 2001 the algebraic computation package Maple has evolved from Maple V into Maple 13 Accordingly the second edition has been thoroughly updated and new material has been added In this edition there are many more applications examples and exercises all with solutions and new chapters on neural networks and simulation have been

added There are also new sections on perturbation methods normal forms Gr bner bases and chaos synchronization This book provides an introduction to the theory of dynamical systems with the aid of the Maple algebraic manipulation package It is written for both senior undergraduates and graduate students The first part of the book deals with continuous systems using ordinary differential equations Chapters 1-10 the second part is devoted to the study of discrete dynamical systems Chapters 11-15 and Chapters 16-18 deal with both continuous and discrete systems Chapter 19 lists examination type questions used by the author over many years one set to be used in a computer laboratory with access to Maple and the other set to be used without access to Maple Chapter 20 lists answers to all of the exercises given in the book It should be pointed out that dynamical systems theory is not limited to these topics but also encompasses partial differential equations integral and integro differential equations stochastic systems and time delay systems for instance References 1-5 given at the end of the Preface provide more information for the interested reader

Mathematics for Engineers and Scientists, Sixth Edition Alan Jeffrey, 2004-08-10 Since its original publication in 1969 Mathematics for Engineers and Scientists has built a solid foundation in mathematics for legions of undergraduate science and engineering students It continues to do so but as the influence of computers has grown and syllabi have evolved once again the time has come for a new edition Thoroughly revised to meet the needs of today's curricula Mathematics for Engineers and Scientists Sixth Edition covers all of the topics typically introduced to first or second year engineering students from number systems functions and vectors to series differential equations and numerical analysis Among the most significant revisions to this edition are Simplified presentation of many topics and expanded explanations that further ease the comprehension of incoming engineering students A new chapter on double integrals Many more exercises applications and worked examples A new chapter introducing the MATLAB and Maple software packages Although designed as a textbook with problem sets in each chapter and selected answers at the end of the book Mathematics for Engineers and Scientists Sixth Edition serves equally well as a supplemental text and for self study The author strongly encourages readers to make use of computer algebra software to experiment with it and to learn more about mathematical functions and the operations that it can perform

Computational Technologies Petr N. Vabishchevich, 2014-12-11 This book discusses questions of numerical solutions of applied problems on parallel computing systems Nowadays engineering and scientific computations are carried out on parallel computing systems which provide parallel data processing on a few computing nodes In the development of up to date applied software this feature of computers must be taken into account for the maximum efficient usage of their resources In constructing computational algorithms we should separate relatively independent subproblems in order to solve them on a single computing node

Mathematical Reviews, 2003 **Mathematical Modelling** Reinhard Illner, 2005 This is an ideal text for classes on modelling It can also be used in seminars or as preparation for mathematical modelling competitions

Mathematical Modelling J. Caldwell, Y.M. Ram, 2013-06-29 Over the past decade there has been an increasing demand for

suitable material in the area of mathematical modelling as applied to science and engineering There has been a constant movement in the emphasis from developing proficiency in purely mathematical techniques to an approach which caters for industrial and scientific applications in emerging new technologies In this textbook we have attempted to present the important fundamental concepts of mathematical modelling and to demonstrate their use in solving certain scientific and engineering problems This text which serves as a general introduction to the area of mathematical modelling is aimed at advanced undergraduate students in mathematics or closely related disciplines e g students who have some prerequisite knowledge such as one variable calculus linear algebra and ordinary differential equations Some prior knowledge of computer programming would be useful but is not considered essential The text also contains some more challenging material which could prove attractive to graduate students in engineering or science who are involved in mathematical modelling In preparing the text we have tried to use our experience of teaching mathematical modelling to undergraduate students in a wide range of areas including mathematics and computer science and disciplines in engineering and science An important aspect of the text is the use made of scientific computer software packages such as MAPLE for symbolic algebraic manipulations and MATLAB for numerical simulation *Mathematical Modelling* J. Caldwell, Douglas K.S. Ng, 2004-03-31

Over the past decade there has been an increasing demand for suitable material in the area of mathematical modelling as applied to science engineering business and management Recent developments in computer technology and related software have provided the necessary tools of increasing power and sophistication which have significant implications for the use and role of mathematical modelling in the above disciplines In the past traditional methods have relied heavily on expensive experimentation and the building of scaled models but now a more flexible and cost effective approach is available through greater use of mathematical modelling and computer simulation In particular developments in computer algebra symbolic manipulation packages and user friendly software packages for large scale problems all have important implications in both the teaching of mathematical modelling and more importantly its use in the solution of real world problems Many textbooks have been published which cover the art and techniques of modelling as well as specific mathematical modelling techniques in specialist areas within science and business In most of these books the mathematical material tends to be rather tailor made to fit in with a one or two semester course for teaching students at the undergraduate or postgraduate level usually the former This textbook is quite different in that it is intended to build on and enhance students modelling skills using a combination of case studies and projects **Choice**, 2003 *Differential Equations* Glenn Ledder, 2005 Ledder's innovative student centered approach reflects recent research on successful learning by emphasizing connections between new and familiar concepts and by engaging students in a dialogue with the material Though streamlined the text is also flexible enough to support a variety of teaching goals in part through optional topics that give instructors considerable freedom in customizing their courses Linear algebra is presented in self contained sections to accommodate both courses that have a

linear algebra prerequisite and those that do not Throughout the text a wide variety of examples from the physical life and social sciences among other areas are employed to enhance student learning In depth Model Problems drawn from everyday experience highlight the key concepts or methods in each section Other innovative features of the text include Instant Exercises that allow students to quickly test new skills and Case Studies that further explore the powerful problem solving capability of differential equations Readers will learn not only how to solve differential equations but also how to apply their knowledge to areas in mathematics and beyond
