Quality Function Deployment for Buildable and Sustainable Construction Singhaputtangkul Natee, Sui Pheng Low, Evelyn A. L. Teo, 2015-10-16 This book focuses on the implementation of Quality Function Deployment QFD in the construction industry as a tool to help building designers arrive at optimal decisions for external envelope systems with sustainable and buildable design goals In particular the book integrates special features into the conventional QFD tool to enhance its performance These features include a fuzzy multi criteria decision making method fuzzy consensus scheme and Knowledge Management System KMS This integration results in a more robust decision support tool known as the Knowledge based Decision Support System QFD KBDSS QFD tool As an example the KBDSS QFD tool is used for the assessment of building envelope materials and designs for high rise residential buildings in Singapore in the early design stage The book provides the reader with a conceptual framework for understanding the development of the KBDSS QFD tool The framework is presented in a generalized form in order to benefit building professionals decision makers analysts academics and researchers who can use the findings as guiding principles to achieve optimal solutions and boost efficiency

**A Knowledge-based System for Curtain Wall Construction** Photjana Assavabanya,1992 Panelized Wall Construction ES. Lindow,LF. Jasinski,2003 Today s building construction requires speed efficiency and economy To meet these needs prefabricated wall panels are being incorporated in curtain wall systems creating a rapidly expanding market To illustrate concepts benefits and needed research and development the design and use of a panelized wall system are discussed The prefabricated panels are manufactured using steel studs and a mechanically fastened rigid board sheathing The exterior envelope can then be completed using a factory installed EIFS exterior insulation finish system or a conventionally built brick masonry veneer The development and constructability of the panelized curtain wall system are described along with associated design and code validation testing In addition the need to integrate water management details into the curtain wall design is also reviewed A current construction project provides the transition from design to installation and exemplifies the benefits of panelized construction An Introduction to Glass and Metal Curtain Wall and Masonry Building Envelope Systems J. **High Performance Curtain Wall Mullion Section Design with Various Densities of Gyroid** Min Jeong Kang (M. Eng.),2016 The thermal bridge problem in building fagades has become a topic of interest as the energy performance of building enclosure design required improvements with a global lead in sustainable building design Curtain wall fagade systems are widely used for recent high rise buildings and the thermal bridge issue occurs mainly within the aluminum frame of the curtain wall system In addition to the thermal bridging effects the conventional curtain wall fagade designs have limitations in increasing the stiffness of the mullion As to address the lack of an innovative solution to solve both issues this thesis proposes utilizing a cellular structure in mullion design In particular this thesis has selected a single gyroid structure which is an open cell foam structure that has the minimum surface area necessary to span a region of space The thesis explores various aspects of the application that extend from a rapid modeling method of gyroid structure experiments and simulations along with theoretical values for mechanical and thermal properties of gyroid to topology optimization of the various densities of gyroid in the composite structure The results are expected to improve the curtain wall designs with future experimental verifications Curtain Wall Design Manual United States Gypsum Co,1977\* **Deflection Gap Study for Cold-formed Steel Curtain Wall Systems** Barbara L. Monroy,2009 Cold formed steel has become a preferred

building material for wall framing in many different types of structures One of its main uses has been as non structural members in curtain wall assemblies of structural steel framed buildings In an exterior wall application the main purpose of the curtain wall is to transfer out of plane loads to the steel frame while not supporting any superimposed gravity loads Therefore when the curtain wall is in the plane of the structural steel frame the vertical deflection of the spandrel beam directly above the wall must be known to provide the appropriate deflection gap between the beam and the curtain wall so that gravity loads are not transferred to the wall Common practice is to size the gap for the deflection from 100% of the live load In some cases the deflection gap may be significant and since this gap must also be provided in the exterior cladding of the wall it creates a design issue for the architect This report presents the results of an investigation into the feasibility of reducing the size of the deflection gap when the wall is located directly under the spandrel beam In this study analytical models were developed for common design situations of curtain walls constructed of cold formed steel studs in structural steel framed buildings This study investigates two common stud heights combined with different floor live loads Taking into account that wall studs have some available axial compressive strength a procedure was developed to determine an appropriate reduction for the gap Using an iterative process a relationship is made between the axial compressive strength of the stud and the amount of axial load the stud can support to establish a factor which gives the percentage the live load gap for 100% live load can be safely reduced by

**Advanced Connection Systems for Architectural Glazing** Roham Afghani Khoraskani,2015-03-02 This book presents the findings of a detailed study to explore the behavior of architectural glazing systems during and after an earthquake and to develop design proposals that will mitigate or even eliminate the damage inflicted on these systems The seismic behavior of common types of architectural glazing systems are investigated and causes of damage to each system identified Furthermore depending on the geometrical and structural characteristics the ultimate horizontal load capacity of glass curtain wall systems is defined based on the stability of the glass components Detailed attention is devoted to the incorporation of advanced connection devices between the structure of the building and the building envelope system in order to minimize the damage to glazed components An innovative new connection device is introduced that results in a delicate and functional system easily incorporated into different architectural glazing systems including those demanding maximum transparency
