Measurement, Mathematics and New Quantification Theory Shizuhiko Nishisato, 2023-06-12 The purpose of this book is to thoroughly prepare diverse areas of researchers in quantification theory As is well known quantification theory has attracted the attention of a countless number of researchers some mathematically oriented and others not but all of them are experts in their own disciplines Quantifying non quantitative qualitative data requires a variety of mathematical and statistical strategies some of which are quite complicated Unlike many books on quantification theory the current book

places more emphasis on preliminary requisites of mathematical tools than on details of quantification theory As such the book is primarily intended for readers whose specialty is outside mathematical sciences The book was designed to offer non mathematicians a variety of mathematical tools used in quantification theory in simple terms Once all the preliminaries are fully discussed quantification theory is then introduced in the last section as a simple application of those mathematical procedures fully discussed so far The book opens up further frontiers of quantification theory as simple applications of basic mathematics

Semilinear Elliptic Equations for Beginners Marino Badiale, Enrico Serra, 2010-12-07 Semilinear elliptic equations are of fundamental importance for the study of geometry physics mechanics engineering and life sciences The variational approach to these equations has experienced spectacular success in recent years reaching a high level of complexity and refinement with a multitude of applications Additionally some of the simplest variational methods are evolving as classical tools in the field of nonlinear differential equations This book is an introduction to variational methods and their applications to semilinear elliptic problems Providing a comprehensive overview on the subject this book will support both student and teacher engaged in a first course in nonlinear elliptic equations The material is introduced gradually and in some cases redundancy is added to stress the fundamental steps in theory building Topics include differential calculus for functionals linear theory and existence theorems by minimization techniques and min max procedures Requiring a basic knowledge of Analysis Functional Analysis and the most common function spaces such as Lebesgue and Sobolev spaces this book will be of primary use to graduate students based in the field of nonlinear partial differential equations It will also serve as valuable reading for final year undergraduates seeking to learn about basic working tools from variational methods and the management of certain types of nonlinear problems
