Practical Methods Of Optimization:

Practical Methods of Optimization R. Fletcher, 2013-06-06 Fully describes optimization methods that are currently most valuable in solving real life problems Since optimization has applications in almost every branch of science and technology the text emphasizes their practical aspects in conjunction with the heuristics useful in making them perform more reliably and efficiently To this end it presents comparative numerical studies to give readers a feel for possible applications and to illustrate the problems in assessing evidence Also provides theoretical background which provides insights into how methods are derived This edition offers revised coverage of basic theory and standard techniques with updated discussions of line search methods Newton and quasi Newton methods and conjugate direction methods as well as a comprehensive treatment of restricted step or trust region methods not commonly found in the literature Also includes recent developments in hybrid methods for nonlinear least squares an extended discussion of linear programming with new methods for stable updating of LU factors and a completely new section on network programming Chapters include computer subroutines worked examples and study questions

Adam B. Levy, 2009-01-01 This textbook provides undergraduate students with an introduction to optimization and its uses for relevant and realistic problems The only prerequisite for readers is a basic understanding of multivariable calculus because additional materials such as explanations of matrix tools are provided in a series of Asides both throughout the text at relevant points and in a handy appendix

Reformulation: Nonsmooth, Piecewise Smooth, Semismooth and Smoothing Methods Masao Fukushima, Liqun Qi, 1999 The concept of reformulation has long played an important role in mathematical programming A classical example is the penalization technique in constrained optimization More recent trends consist of reformulation of various mathematical programming problems including variational inequalities and complementarity problems into equivalent systems of possibly nonsmooth piecewise smooth or semismooth nonlinear equations or equivalent unconstrained optimization problems that are usually differentiable but in general not twice differentiable The book is a collection of peer reviewed papers that cover such diverse areas as linear and nonlinear complementarity problems variational inequality problems nonsmooth equations and nonsmooth optimization problems economic and network equilibrium problems semidefinite programming problems maximal monotone operator problems and mathematical programs with equilibrium constraints The reader will be convinced that the concept of reformulation provides extremely useful tools for advancing the study of mathematical programming from both theoretical and practical aspects

Audience This book is intended for students and researchers in optimization mathematical programming and operations research
