Non Equilibrium Thermodynamics Lecture Notes:

Understanding Non-equilibrium Thermodynamics Georgy Lebon, David Jou, 2008-01-12 Our time is characterized by an explosion of information and by an acceleration of knowledge. A book cannot compete with the huge amount of data available on the Web. However, to assimilate all this information, it is necessary to structure our knowledge in a useful conceptual framework. The purpose of the present work is to provide such a structure for students and researchers interested by the current state of the art of non-equilibrium thermodynamics. The main features of the book are a concise and critical presentation of the basic ideas, illustrated by a series of examples selected not only for their pedagogical value but also for the perspectives offered by recent technological advances. This book is aimed at students and researchers in physics, chemistry, engineering, material sciences, and biology. We have been guided by two apparently antagonistic objectives: generality and simplicity. To make the book accessible to a large audience of non-specialists, we have decided about a simplified but rigorous presentation. Emphasis is put on the underlying physical background without sacrificing mathematical rigour, the several formalisms being illustrated by a list of examples and problems. Altogether, this work has been guided by the formula: Get more from the less, with the purpose to make a maximum of people aware of a maximum of knowledge from a minimum of basic tools. Besides being an introductory text, our objective is to present an overview as general as possible of the more recent developments in non-equilibrium thermodynamics, especially beyond the local equilibrium description.

Non-equilibrium Thermodynamics Of Heterogeneous Systems (Second Edition) Signe Kjelstrup, Dick Bedeaux, 2020-08-27 This book utilizes non-equilibrium thermodynamics to describe transport in complex heterogeneous media. There are large coupling effects between transport of heat, mass, charge, and chemical reactions at surfaces, and it is important to know how one should properly integrate across systems where different phases are in contact. There is no other book available today that gives a prescription of how to set up flux equations for transports across heterogeneous systems.

Differential Geometric Foundations of Non-Equilibrium Thermodynamics Marcus Hildebrandt, 2025-02-27 While all field theories are nowadays available in a modern differential geometric coordinate-free formulation on manifolds, this has been so far only rudimentarily accomplished in general non-equilibrium thermodynamics. In this work, it is shown how a fitting geometric structure can be derived for arbitrary compact discrete Schottky systems, thermodynamic systems such as stars and black holes, using only a few thermodynamic principles. This leads to deep geometric insights. Some central results are the following: while in the theory of relativity the energy-momentum tensor determines the geometry of the space, in non-equilibrium thermodynamics the 1-form of the entropy production rate is responsible for the emergence of a well-known geometric structure: the contact geometry. Relaxation processes remain in the fibers in which they start and end on an attractor manifold that can be identified with the classical equilibrium subspace of thermostatics. One then proves that outside this attractor manifold, there are no reversible process directions. As a

consequence of this the 2nd Law of thermodynamics lives mainly on the fibers of the state manifold the so called vertical geometric structure while the 1st Law of thermodynamics is formulated on the horizontal components of the state manifold The internal energy provides a physical gauge for each fiber The 1st and 2nd Law of thermodynamics are coupled via the representation of the entropy flux 1 form that can be represented in the dual basis of exchange 1 forms such as the heat 1 form This fact can be used to provide a coordinate free invariant definition of non equilibrium temperature Finally it is shown that probably the most general geometric structure to model non equilibrium thermodynamics of compact discrete Schottky systems systems is given by a composite fibred cocontact phase manifold that includes time as an explicit dimension

Nonequilibrium Statistical Physics Roberto Livi, Paolo Politi, 2017-10-05 Statistical mechanics has been proven to be successful at describing physical systems at thermodynamic equilibrium Since most natural phenomena occur in nonequilibrium conditions the present challenge is to find suitable physical approaches for such conditions this book provides a pedagogical pathway that explores various perspectives The use of clear language and explanatory figures and diagrams to describe models simulations and experimental findings makes the book a valuable resource for undergraduate and graduate students and also for lecturers organizing teaching at varying levels of experience in the field Written in three parts it covers basic and traditional concepts of nonequilibrium physics modern aspects concerning nonequilibrium phase transitions and application orientated topics from a modern perspective A broad range of topics is covered including Langevin equations Levy processes directed percolation kinetic roughening and pattern formation

Non-equilibrium Energy Transformation Processes Viktor Holubec, 2014-05-22 Various experimental techniques have been advanced in recent years to measure non equilibrium energy transformations on the microscopic scale of single molecules In general the systems studied in the corresponding experiments are exposed to strong thermal fluctuations and thus the relevant energetic variables such as work and heat become stochastic This thesis addresses challenging theoretical problems in this active field of current research 1 Exact analytical solutions of work and heat distributions for isothermal non equilibrium processes in suitable

models are obtained 2 Corresponding solutions for cyclic processes involving two different heat reservoirs are found 3 Optimization of periodic driving protocols for such cyclic processes with respect to maximal output power efficiency and minimal power fluctuations is studied The exact solutions for work and heat distributions provide a reference for theoretical investigations of more complicated models giving insight into the structure of the tail of work distributions and serving as valuable test cases for simulations of the underlying stochastic processes
