

25 Advanced SQL Query Examples with Explanations

Example #1 - Ranking Rows Based on a Specific Ordering Criteria

Sometimes we need to create a SQL query to show a ranking of rows based on a specific order criteria. In this example query, we will show a list of all employees ordered by salary (highest salary first). The report will include the position of each employee in the ranking.

Here's the code:

```
SELECT
  employee_id,
  last_name,
  first_name,
  salary,
  RANK() OVER (ORDER BY salary DESC) as ranking
FROM employee
ORDER BY ranking
```

In the above query, we use the function `RANK()`. It is a window function that returns each row's position in the result set, based on the order defined in the `OVER` clause (1 for the highest salary, 2 for the second-highest, and so on). We need to use an `ORDER BY` ranking clause at the end of the query to indicate the order on which the result set will be shown.

If you want to know more about ranking functions in SQL, I recommend our article [What Is the RANK\(\) Function in SQL, and How Do You Use It?](#)

Example #2 - List The First 5 Rows of a Result Set

The next SQL query creates a report with the employee data for the top 5 salaries in the company. This kind of report must be ordered based on a given criteria; in our example, the order criteria will again be `salary DESC`:
