Four Quadrant Dc Motor Speed Control Using Arduino 1:

DC Motor Control - A case study MOHAMMED ASLAM HUSAIN,2018-11-20 In this book the four quadrant speed control system for DC motor has been studied and constructed To achieve speed control an electronic technique called pulse width modulation is used which generates high and low pulses These pulses vary in the speed of the engine For the generation of these pulses a microcontroller is used It is a periodic change in the program Different speed grades and the direction are depended on different buttons The experiment has proved that this system is higher performance Speed control of a machine is the most vital and important part of any industrial organization This paper is designed to develop a four quad speed control system for a DC motor using microcontroller The engine is operated in four quadrants ie clockwise counterclockwise forward brake and reverse brake It also has a feature of speed control The four quadrant operation of the dc engine is best suited for industries where engines are used and as a requirement they can rotate in clockwise counter clockwise and thus apply brakes immediately in both the directions In the case of a specific operation in an industrial environment the engine needs to be stopped immediately In this scenario this system is very integral The PWM pulses generated by the microcontroller are instantaneous in both directions and as a result of applying the PWM pulses The microcontroller used in this project is from 8051 family Push buttons are provided for the operation of the motor which are interfaced to the microcontroller that provides an input signal to it and controls the speed of the engine through a motor driver IC The speed and direction of DC motor has been observed on digital CRO

adjust some variable to hold the measurement or process variable at the set point This project is focusing on implementing PI controller to control speed of a dc motor The overall project is divided into two parts The first part is concern on the simulation using MATLAB simulink where the dc motor is modeled and PI controller is tuned using Ziegler Nichols rules and software tuning The second part is implementing the simulation This part is divided into another two parts Graphical User Interface GUI development and hardware interfacing GUI is built using National Instrument LabVIEW software with implementation of PI controller An oscilloscope also had been build there Hardware interfacing part is built with Mitsumi dc mini motors M31E 1 Series speed sensor and analog to digital converter DAC8032 As the result PI controller is capable to control the speed of dc motor followed the result from simulation

Speed Control of Separately Excited DC Motor Using Neuro Fuzzy Technique , This paper uses NEURO FUZZY TECHNIQUE in estimating speed and controlling it for a separately excited DC motor The rotor speed of the dc motor can be made to follow an arbitrarily selected trajectory The purpose is to achieve accurate trajectory control of the speed of saperately excited DC Motor especially when the motor and load parameters are unknown Such a neuro fuzzy control scheme consists of two parts One is the neural identifier which is used to estimate the motor speed error state error or state error derivative The second is the fuzzy logic controller which is used to generate a control signal for a chopper speed control of separately excited DC Motor The purpose of this technique is to achieve accurate trajectory control of the speed Such a control scheme consists of two parts One is the neural identifier which is used to estimate the motor speed The other is the neural fuzzy logic controller which is used to generate the control signal fuzzy output

Speed Control of DC Motor by Using Fuzzy Logic Controller Khairul Afiq Zakaria,2012 The automatic control has played a vital role in the advance of engineering and science Nowadays in industries the control of direct current DC motor is a common practice thus the implementation of DC motor of controller speed is important The main purpose of motor speed control is to keep the rotation of the motor at the present speed and to drive a system at the demand speed The DC Series Wound Motor is very popular in industrial application and control systems because of the high torque density high efficiency and small size The main purpose of this project is to control speed of DC Series Wound Motor using four controllers which are PID PI P and Fuzzy Logic Controller FLC Initially all the controllers are developed by using MATLAB simulink model In this project PID PI and P controller are developed and tuned in order to get faster step response and the Fuzzy Logic Controller FLC is design based on the membership function and the rule base The expectation of this project is the Fuzzy Logic Controller will get the best performance compared to other controllers in terms of settling time T_s rise time T_r peak time T_p and percent overshoot %OS Finally a GUI of these controllers are developed which allow the users to select any controller and change its parameters according to the different conditions under loaded and unloaded scenarios

Direction and Speed Control of DC Motor Norfadilah Zulkefli,2012 Direct current motor is an important drive configuration for many applications across a wide range of powers and speeds It have variable characteristics and used

extensively in variable speed drives The goals of this project are to control the direction and speed of Direct Current DC motor The Radio Frequency RF modules also used to make this project as a user friendliness to control the interface yet make it more useful This project divided into two part of circuit First circuit is for transmitter and another circuit is for the receiver Pulse Width Modulation PWM technique is used where its signal is generated by PIC 18F4550 The PWM signal will send to the motor driver to vary the voltage supply to the motor in a desired speed The DC Motor driver L293D is used in this project as it is a component that has dual full bridge driver where it also can control the direction of the DC motor A rotary encoder plate is coupled to the end of motor shaft to provide the feedback speed signal to the controller The RF modules used here are NT T10A for transmitter module and CWC 12 for the receiver module Four push buttons are built at the transmitter side as switches to control the speed and direction of DC motor The four switches are interfaced to the RF transmitter module through PIC 18F4550 16 x 2 Liquid Crystal Display LCD Modules is added at receiving side It functions to display the outputs or corresponding action that obtain from the PIC 18F4550 In conclusion the direction and speed of DC motor can be controlled Plus this motor controller can be applied as a basis in roboting system kid s toys and also industrial field

Direct current DC motors have variable characteristics and are used extensively in variable speed drives DC motor can provide a high starting torque and it is also possible to obtain speed control over wide range Why do we need a seed motor controller For example if we have a DC motor in a robot if we just apply a constant power to each motor on a robot then the poor robot will never be able to maintain a steady speed It will go slower over carpet faster over smooth flooring slower up hill faster down hill etc So it is important to make a controller to control the speed of DC motor in desired speed DC motor plays a significant role in modern industrial These are several types of applications where the load on the DC motor varies over a speed range These applications may demand high speed control accuracy and good dynamic responses In home applications washers dryers and compressors are good example In automotive fuel pump control electronic steering control engine control and electric vehicle control are good examples of these In aerospace there are a number of applications like centrifuges pumps robotic arm controls gyroscope controls and so on
