Cookbook Adrián Sergio Pulvirenti,2011-06-23 Over 70 recipes to solve ETL problems using Pentaho Kettle **ETL Testing Analyzer** Claudiu-Ionut Murar,2014 ETL testing techniques are nowadays widely used into the data integration process These techniques refer to the ability of being able to check whether the information that is loaded into the data warehouse has correctly followed all the transformations steps Due to the errors that might occur during the extraction transformation and load stages there is a need to monitor and handle the errors that can cause severe data quality issues into the data warehouse This thesis paper is based on the information gathered from a previous project that was performed at UPC The main goal of this project was to help the professors from UPC who are teaching the Database course to better analyze the performance of the students Therefore an ETL system was implemented with the goal of extracting student

information from multiple sources transform and load it into the data warehouse This information can refer to the student s personal data the exercises they are performing etc The initial ETL design was based on the creation of the data warehouse schema containing the main dimensions and fact tables The main issue is that it did not present any monitoring and error handling functionalities even though the system was generating several errors every time the ETL was executed The steps I have followed while working on this thesis project have been to model the initial ETL process using a BPMN representation include error handling and monitoring functionalities and ultimately redesign the initial ETL processes using a chosen tool Although the initial processes were modelled using Pentaho Kettle due to the new requirements regarding the error handling and monitoring capabilities I had to perform a comprehensive ETL tool comparison to check what is the tool that can better answer the requirements of this project

Open Source ETL-The Prodigy Kids Binayaka Mishra,2017-06-19 It s said ETL concept gained popularity in the 1970s when organizations began using multiple data repositories or databases to store different types of business information but only as a technical concept The need to integrate data that was spread across these databases grew quickly ETL became the standard method for taking data from disparate sources and transforming it before loading it to a target source or destination In the late 1980s and early 1990s data warehouses came onto the scene A distinct type of database data warehouses provided integrated access to data from multiple systems mainframe computers minicomputers personal computers and spreadsheets Coupled with mergers and acquisitions many organizations wound up with several different ETL solutions that were not integrated

Pentaho Data Integration María Carina Roldán,2013 [A Courseware on ETL Process](#) Nithin

Vijayendra, California State University, Sacramento, 2010 Extract Transform and Load ETL is a fundamental process used to populate a data warehouse. It involves extracting data from various sources, transforming the data according to business requirements, and loading them into target data structures. Inside the transform phase, a well-designed ETL system should also enforce data quality, data consistency, and conform data so that data from various source systems can be integrated. Once the data is loaded into target systems in a presentation-ready format, the end users can run queries against them to generate reports which help them make better business decisions. Even though the ETL process consumes roughly 70% of computing resources, they are hardly visible to the end users.

5 The objective of this project is to create a website which contains courseware on the ETL process and a web-based ETL tool. The website containing the ETL courseware can be accessed by anyone with internet access. This will be helpful to a wide range of audience from beginners to experienced users. The website is created using technologies HTML, PHP, Korn shell scripts, and MySQL. The ETL tool is web-based and anyone with internet access can use this tool for free. However, guests have limited access to this tool and registered users have complete access. Using this tool, data can be extracted from text files and MySQL tables combined together and loaded into MySQL tables. Before loading the data into target MySQL tables, various transformations according to business requirements can be applied to them. This tool is developed using HTML, PHP, SQL, and Korn shell scripts.
