Introduction

Design variables provide a method for specifying critical parameters just before a simulation. This allows you to make quick changes to parameter values across single or multiple critical components without having to edit any schematic components. Design variables can also be used in simple parametric analysis, which can change a design variable across a range of values and display multiple simulation results on a single plot.

Using Design Variables

This part of the tutorial will show you how to parametrically vary width of the shafts and their positions of an impeller by using design variables. These variable values are then set using the **Running Through Environment** panel in simulation.

1. Make a copy of the geometry with dimensions you have parametrically designed, or create a new one.
2. Open the dimensions of the model.
3. Right click on the WIDTH dimension to edit it, and name the parameter by either clicking on it and entering **Parameter**, or you can press "q" as a shortcut.
4. Define the unit in the width box, and type mm . This specifies that a variable called mm will be used to set the width of the SHAFT. When you do this, observe that values for "Dimensional Difference Keys" change from a constant value to a formula that involves the variable mm . Always check to make sure that formula is updated when you change the width to a variable otherwise, your simulation results will be incorrect. Click **OK** to apply the change.
5. Repeat this procedure to change the width of the PSHAFT to mm .
6. Select **Check** \rightarrow **Check and name**. Verify that there are no errors.
7. Launch the **Analysis** **Running Through Environment**.
8. Set up the simulation environment as you normally would for simulating a schematic. This includes specifying a simulation file and transient run length, creating the ANSYS mesh reader in the environment options, and selecting the compute to be plotted on the schematic.
9. In **ANSYS**, select **Variables** \rightarrow **Copy Geometry**. The design variables mm and $psmm$ should appear in the Design Variables area of the **Running Environment** window.
10. In **ANSYS**, select **Variables** \rightarrow **Units**. In the units box, type mm and then apply the value by clicking **Apply**. Change the value of mm to 0.01 and click **Apply**. Check the values have been assigned, click **OK**. See Figure 1 and 2 below.
11. In **ANSYS**, use the connections by selecting **Simulation** \rightarrow **Variable and Run**. After loading the the simulation to complete, the variable values will pop up. The results should be
