Virtual Experiments in Mechanical Vibrations Michael J. Brennan, Bin Tang, 2022-10-10 VIRTUAL EXPERIMENTS in MECHANICAL VIBRATIONS The first book of its kind to explain fundamental concepts in both vibrations and signal processing using MATLAB virtual experiments Students and young engineers with a strong grounding in engineering theory often lack the practical skills and knowledge required to carry out experimental work in the laboratory Fundamental and time consuming errors can be avoided with the appropriate training and a solid understanding of basic concepts in vibrations and or signal processing which are critical to testing new designs Virtual Experiments in Mechanical Vibrations Structural Dynamics and Signal Processing is designed for readers with limited knowledge of vibrations and signal processing The intention is to help them relate vibration theory to measurements carried out in the laboratory With a hands on approach that emphasizes physics rather than mathematics this practical resource explains fundamental concepts in vibrations and signal processing It uses the concept of a virtual experiment together with MATLAB to show how the dynamic properties of vibration isolators can be determined how vibration absorbers can be designed and how they perform on distributed parameter structures Readers will find that this text Allows the concepts of experimental work to be discussed and simulated in the classroom using a physics based approach Presents computational virtual experiments using MATLAB examples to determine the dynamic behaviour of several common dynamic systems Explains the rationale of virtual experimentation and describes typical vibration testing setups Introduces the signal processing tools needed to determine the frequency response of a system from input and output data Includes access to a companion website containing MATLAB code Virtual Experiments in Mechanical Vibrations Structural Dynamics and Signal Processing is a must have resource for researchers mechanical engineers and advanced undergraduate and graduate students who are new to the subjects of vibrations signal processing and vibration testing It is also an invaluable tool for universities where the possibilities of doing experimental work are limited

Structural Dynamics Henry R. Busby, George H. Staab, 2017-08-15 Structural Dynamics Concepts and Applications focuses on dynamic problems in mechanical civil and aerospace engineering through the equations of motion The text explains structural response from dynamic loads and the modeling and calculation of dynamic responses in structural systems A range of applications is included from various engineering disciplines Coverage progresses consistently from basic to advanced with emphasis placed on analytical methods and numerical solution techniques Stress analysis is discussed and MATLAB applications are integrated throughout A solutions manual and figure slides for classroom projection are available for instructors

Engineering Vibration Daniel J. Inman, 2001 This text presents material common to a first course in vibration and the integration of computational software packages into the development of the text material specifically makes use of MATLAB MathCAD and Mathematica This allows solution of difficult problems provides training in the use of codes commonly used in industry encourages students to experiment with equations of vibration by allowing easy what if solutions This also allows students to make precision response plots computation of frequencies damping ratios and mode shapes This encourages students to learn vibration in an interactive way to solidify the design components of vibration and to integrate nonlinear vibration problems earlier in the text The text explicitly addresses design by grouping design related topics into a single chapter and using optimization and it connects the computation of natural frequencies and mode shapes to the standard eigenvalue problem providing efficient and expert computation of the modal properties of a system In addition the text covers modal testing methods which are typically not discussed in competing texts software to include Mathematica and MathCAD as well as MATLAB in each chapter updated Engineering Vibration Toolbox and web site integration of the numerical simulation and computing into each topic by chapter nonlinear considerations added at the end of each early chapter through simulation additional problems and examples and updated solutions manual available on CD for use in teaching It uses windows to remind the reader of relevant facts outside the flow of the text development It introduces modal analysis both theoretical and experimental It introduces dynamic finite element analysis There is a separate chapter on design and special sections to emphasize design in vibration
